John Owens

Introduction to Computer Architecture

UC Davis EEC 170, Winter 2021

Arithmetic for Computers

■ Operations on integers

- Addition and subtraction
- Multiplication and division
- Dealing with overflow

■ Floating-point real numbers

- Representation and operations

Arithmetic

■ Where we've been:

- Performance (seconds, cycles, instructions)
- Abstractions:
 - Instruction Set Architecture
 - Assembly Language and Machine Language

■ What's up ahead:

- Number Representation
- Implementing an ALU
- Implementing the Architecture

Add WeChat powcoder

32 bit signed numbers

0000 0000 0000 0000 0000 0000 0000 0000_{two} = 0_{ten}
0000 0000 0000 0000 0000 0000 0000 0001_{two} = + 1_{ten}
0000 0000 0000 0000 0000 0000 0000 0010_{two} = + 2_{ten}

...

0111 1111 1111 1111 1111 1111 1111 1110_{two} = + 2,147,483,646_{ten} **maxint**
0111 1111 1111 1111 1111 1111 1111 1111_{two} = + 2,147,483,647_{ten}

1000 0000 0000 0000 0000 0000 0000 0000_{two} = - 2,147,483,648_{ten} **minint**
1000 0000 0000 0000 0000 0000 0000 0001_{two} = - 2,147,483,647_{ten}
1000 0000 0000 0000 0000 0000 0000 0010_{two} = - 2,147,483,646_{ten}

...

1111 1111 1111 1111 1111 1111 1111 1101_{two} = - 3_{ten}
1111 1111 1111 1111 1111 1111 1111 1110_{two} = - 2_{ten}
1111 1111 1111 1111 1111 1111 1111 1111_{two} = - 1_{ten}

What happens if you compute –minint?

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

Two's Complement Operations

- Negating a two's complement number:
invert all bits and add 1

- remember: “negate” and “invert” are quite different!

- Converting n bit numbers into numbers with more than n bits:

- RISC V n bit immediate gets converted to 64 bits for arithmetic
 - copy the most significant bit (the sign bit) into the other bits

0010 ~~-> 0000 0010~~ ~~Add WeChat powcoder~~

1010 ~~-> 1111 1010~~

- “sign extension” (lbu vs. lb)
 - mem [x1] = 0xff
 - lb x2, 0(x1) -> x2 = ffff ffff
 - lbu x2, 0(x1) -> x2 = 0000 00ff

Addition & Subtraction

■ Two's complement operations easy

- subtraction using addition of negative numbers

$$\begin{array}{r} 0111 \quad (7) \\ + 1010 \quad (-6) \\ \hline \end{array} \qquad \begin{array}{r} 0111 \quad (7) \\ - 0110 \quad (6) \\ \hline \end{array}$$

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

Addition & Subtraction

- **Overflow (result too large for finite computer word):**

- adding two n-bit numbers does not yield an n-bit number

$$\begin{array}{r} 1111 \\ + 0001 \\ \hline 10000 \end{array}$$

- **How about -1 + -1?**

Assignment Project Exam Help

<https://powcoder.com>
Add WeChat powcoder

Detecting Overflow

- No overflow when adding a positive and a negative number
- No overflow when signs are the same for subtraction
- Overflow occurs when the value affects the sign:
 - overflow when adding two positives yields a negative
 - or, adding two negatives gives a positive
 - or, subtract a negative from a positive and get a negative
 - or, subtract a positive from a negative and get a positive
- Consider the operations $A + B$, and $A - B$
 - Can overflow occur if B is 0 ?
 - Can overflow occur if A is 0 ?
- HW problem on figuring out exact criteria

Integer Addition

■ Example: $7 + 6$

■ Overflow if result out of range

- Adding +ve and -ve operands, no overflow
- Adding two +ve operands
 - Overflow if result sign is 1
- Adding two -ve operands
 - Overflow if result sign is 0

Integer Subtraction

- Add negation of second operand

- Example: $7 - 6 = 7 + (-6)$

+7: 0000 0000 ... 0000 0111

-6: 1111 1111 ... 1111 1010

+1: 0000 0000 ... 0000 0001

Assignment Project Exam Help

<https://powcoder.com>

- Overflow if result out of range

- Subtracting two +ve or two -ve operands, no overflow
- Subtracting +ve from -ve operand
 - Overflow if result sign is 0
- Subtracting -ve from +ve operand
 - Overflow if result sign is 1

Add WeChat powcoder

Effects of Overflow

- An exception (interrupt) occurs
 - Control jumps to predefined address for exception
 - Interrupted address is saved for possible resumption
- Details based on software system / language
 - example: flight control vs. homework assignment
 - C/Java do not detect overflow
 - Fortran (evidently) can detect overflow
- Don't always want to detect overflow
 - MIPS instructions (but *not* RISC-V): addu, addiu, subu
 - RISC-V advocates branches on overflow instead
 - addiu sign-extends
 - sltu, sltiu for unsigned comparisons

Arithmetic for Multimedia

- Graphics and media processing operates on vectors of 8-bit and 16-bit data
 - Use 64-bit adder, with partitioned carry chain
(this probably doesn't mean anything to you yet, but wait until the end of lecture)
 - Operate on 8×8 bit, 4×16-bit, or 2×32-bit vectors
 - SIMD (single-instruction, multiple data)
- Saturating operations
 - On overflow, result is largest representable value
 - c.f. 2s-complement modulo arithmetic
 - E.g., clipping in audio, saturation in video

Review: Boolean Algebra & Gates

- **Problem: Consider a logic function with three inputs: A, B, and C.**
- **Output D is true if at least one input is true**
- **Output E is true if exactly two inputs are true**
- **Output F is true only if all three inputs are true**

Assignment Project Exam Help

Bit Slices

- Concentrate on one bit of the adder:

- $$\begin{array}{r} 0111 \\ + 0110 \\ \hline \end{array}$$

Assignment Project Exam Help
<https://powcoder.com>

- Could we build the same hardware for every bit?
 - This is a good idea. Why?
 - Each bit's hardware is called a "bit slice"

Truth Table for Adder Bit Slice

- 3 inputs (A, B, Cin); 2 outputs (Sum, Cout)

A	B	Cin	Sum	Cout
0	0	0	0	0
0	0	1	1	0
0	1	0	1	0
0	1	1	0	1
1	0	0	1	0
1	0	1	0	1
1	1	0	0	1
1	1	1	1	1

Adder Equations

- $\text{Sum} = (A \oplus B) \oplus \text{Cin}$
- $\text{Carry} = AB + AC_{\text{in}} + BC_{\text{in}}$

- Abstract as “Full Adder”

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

Cascading Adders

- Cascade Full Adders to make multibit adder:
- $A+B=S$

Arithmetic for Multimedia

- Graphics and media processing operates on vectors of 8-bit and 16-bit data
 - Use 64-bit adder, with partitioned carry chain
(this probably doesn't mean anything to you yet, but wait until the end of lecture)
<https://powcoder.com>
Assignment Project Exam Help
 - Operate on 8×8 bit, 4×16-bit, or 2×32-bit vectors
 - SIMD (single-instruction, multiple data)
Add WeChat powcoder
- Saturating operations
 - On overflow, result is largest representable value
 - c.f. 2s-complement modulo arithmetic
 - E.g., clipping in audio, saturation in video

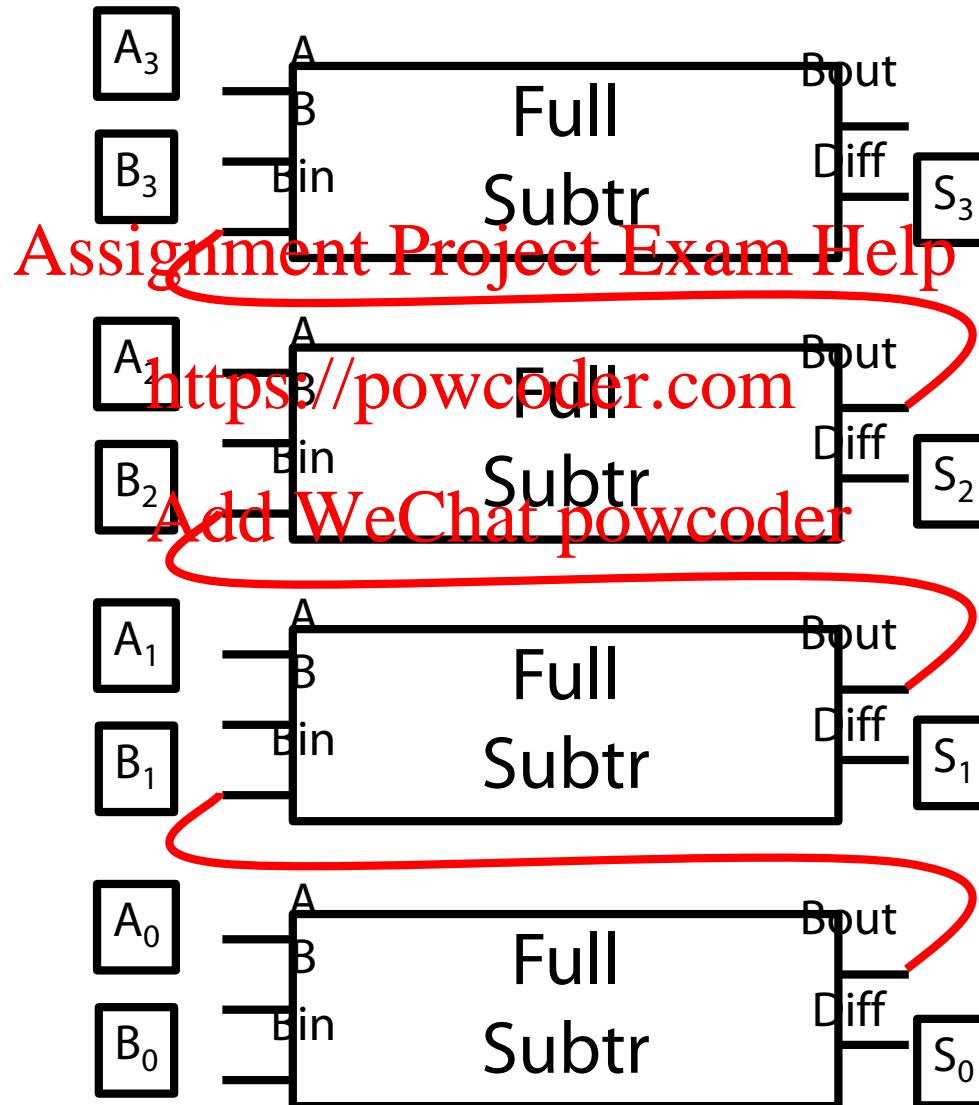

Truth Table for Subtractor Bit Slice

- 3 inputs (A, B, Bin); 2 outputs (Diff, Bout)

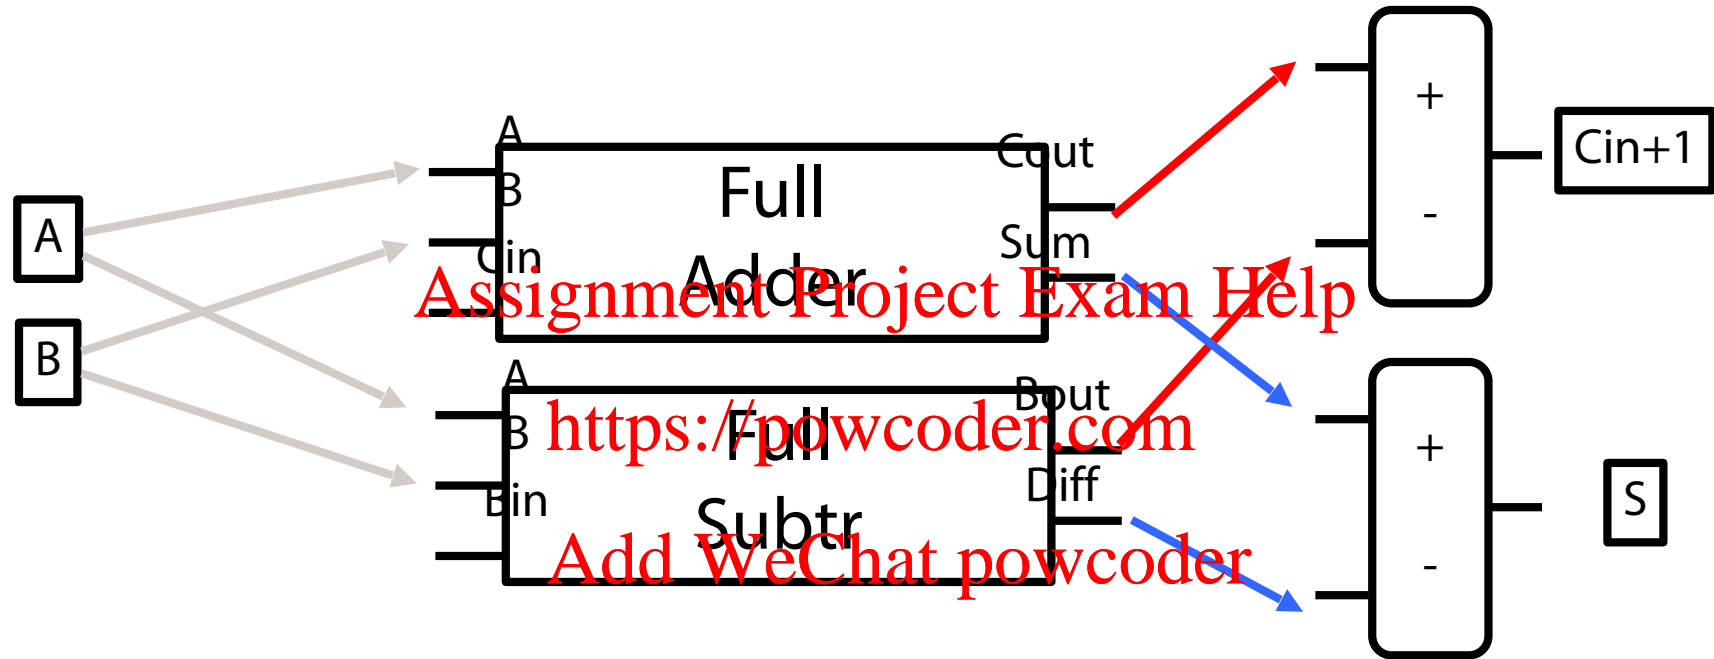

A	B	Bin	Diff	Bout
0	0	0	0	0
0	0	1	1	1
0	1	0	1	1
0	1	1	0	1
1	0	0	1	0
1	0	1	0	0
1	1	0	0	0
1	1	1	1	1

Cascading Subtractors

- Cascade Full Subtrs to make multibit subtr:
- $A-B=S$

How can we combine + and -?

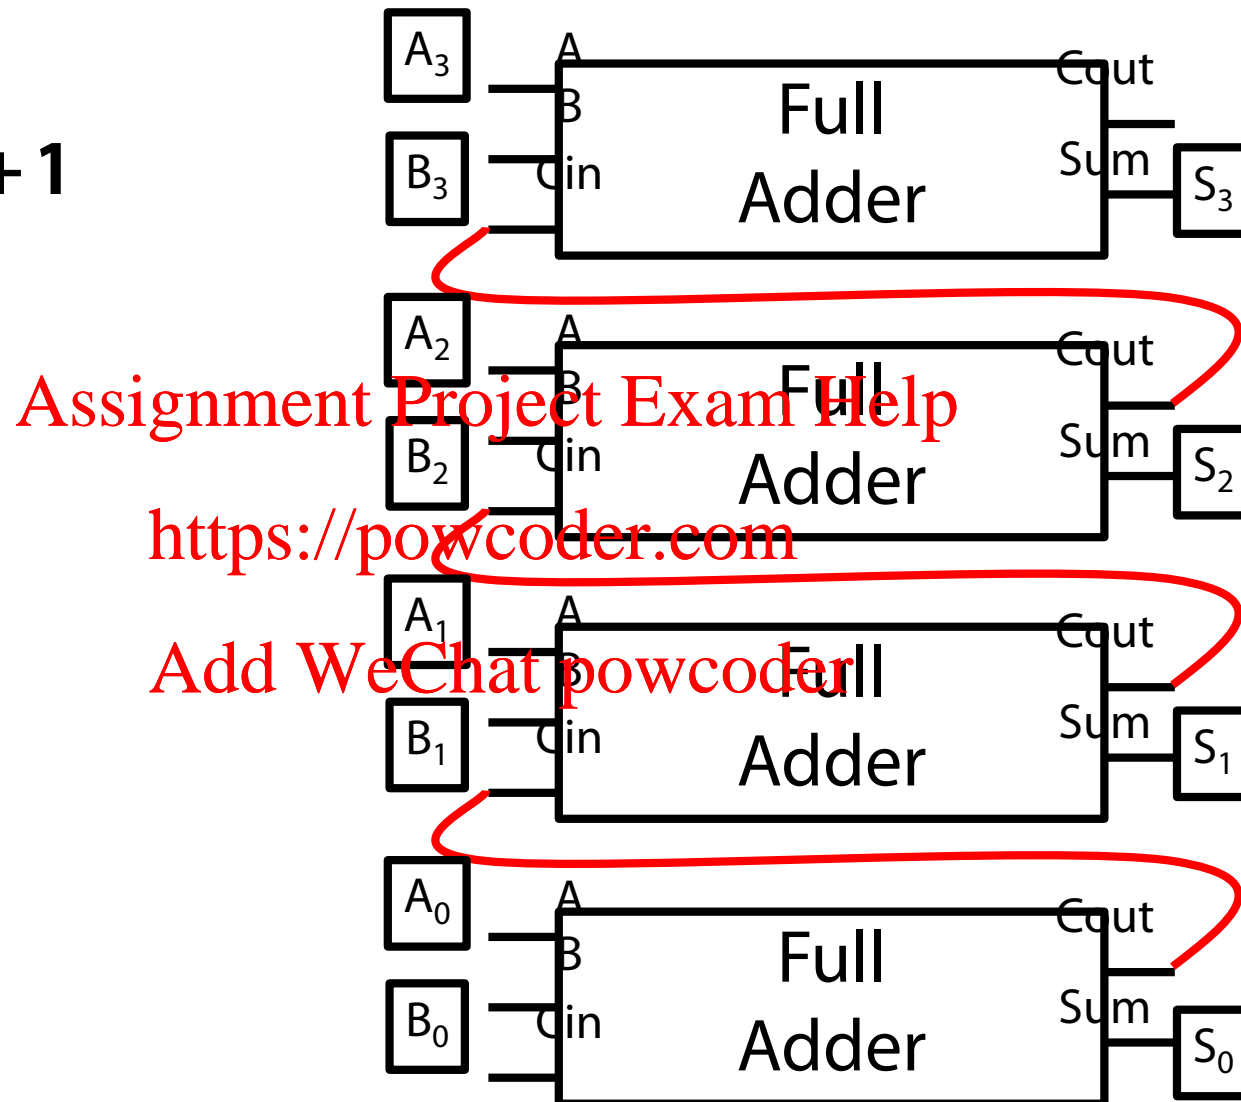

- This is common—it's what we'll do (for example) for logic functions (and, or, etc.)

How can we combine + and -?

$$S = A - B$$

$$S = A + (\sim B) + 1$$

Lest you think this is only theoretical ...

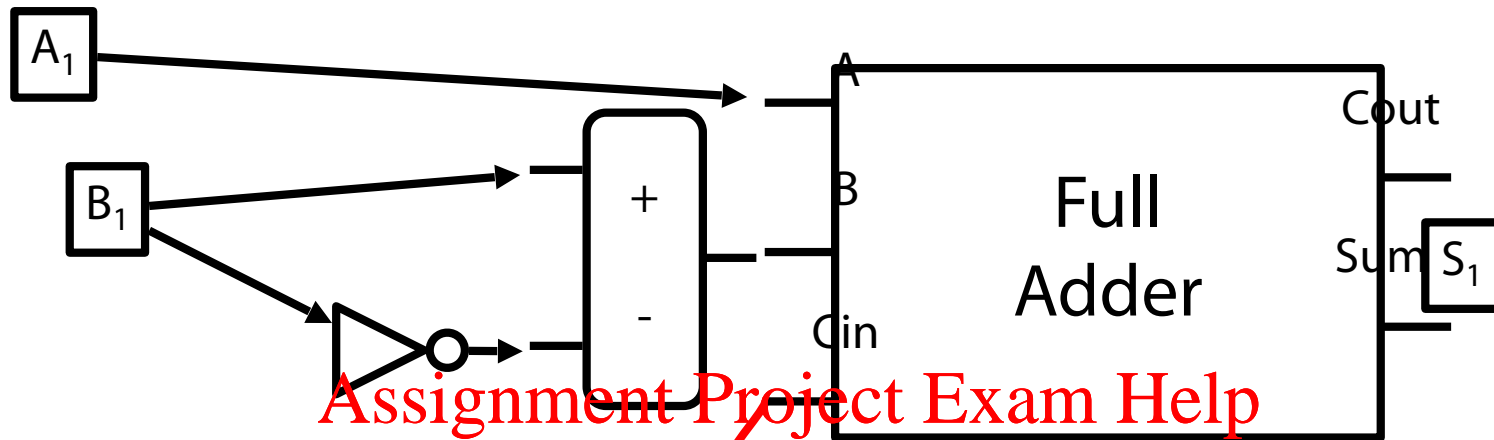

Assignment Project Exam Help

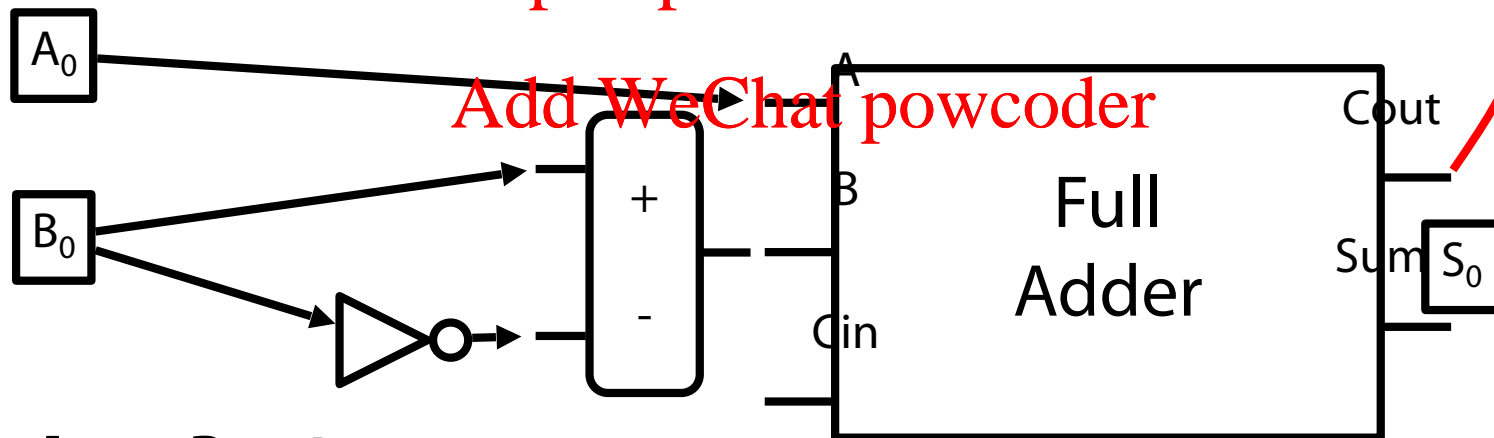

<https://powcoder.com>

Add WeChat powcoder

How can we combine + and -?

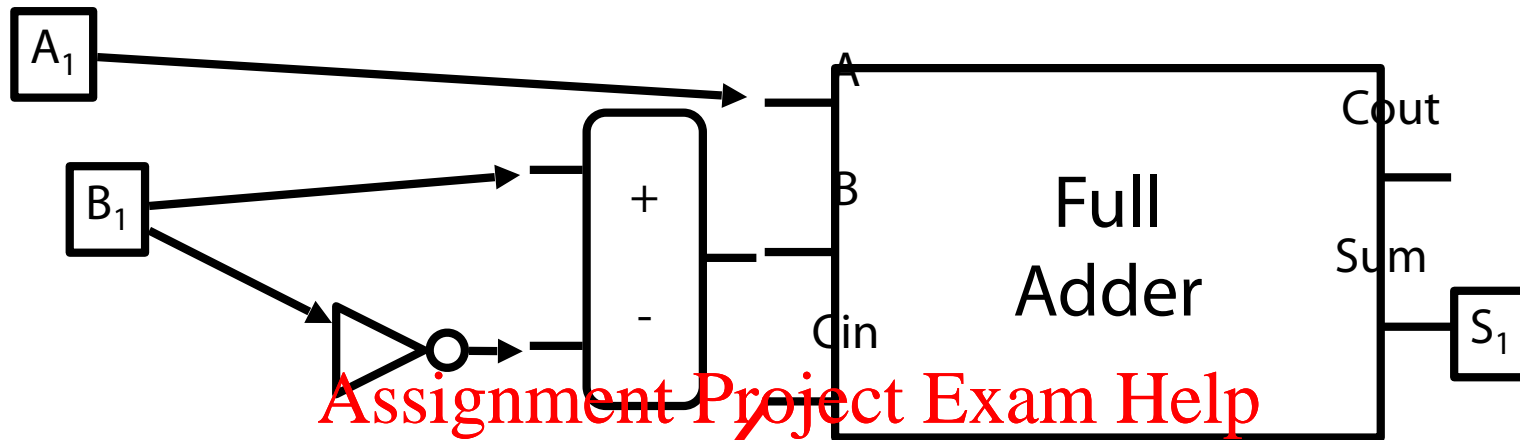

<https://powcoder.com>

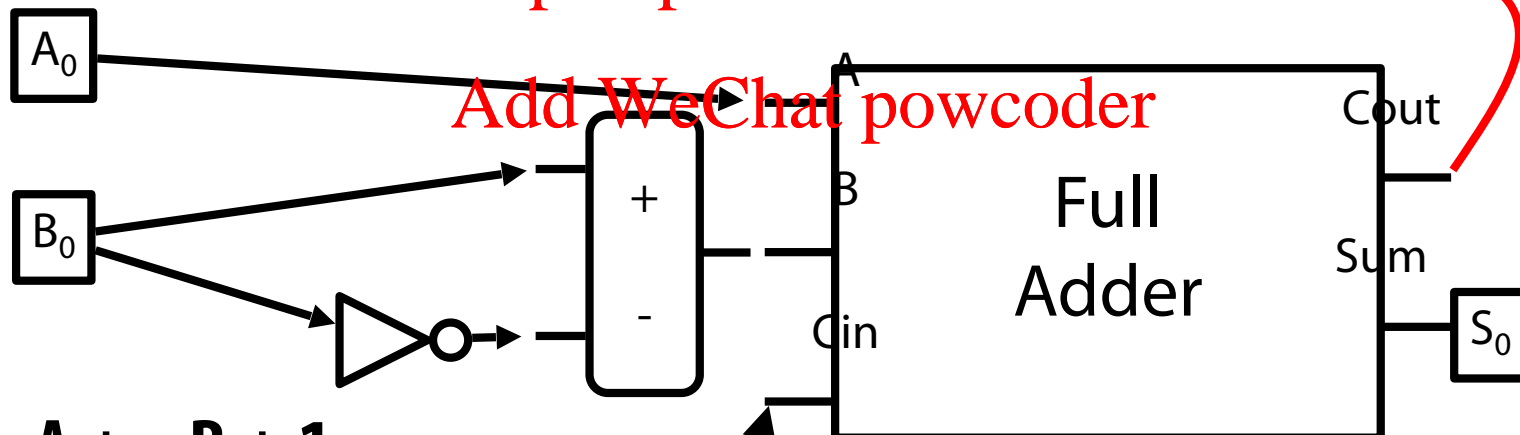

$$S = A + \sim B + 1$$

First, negate B ...

How can we combine + and -?

<https://powcoder.com>

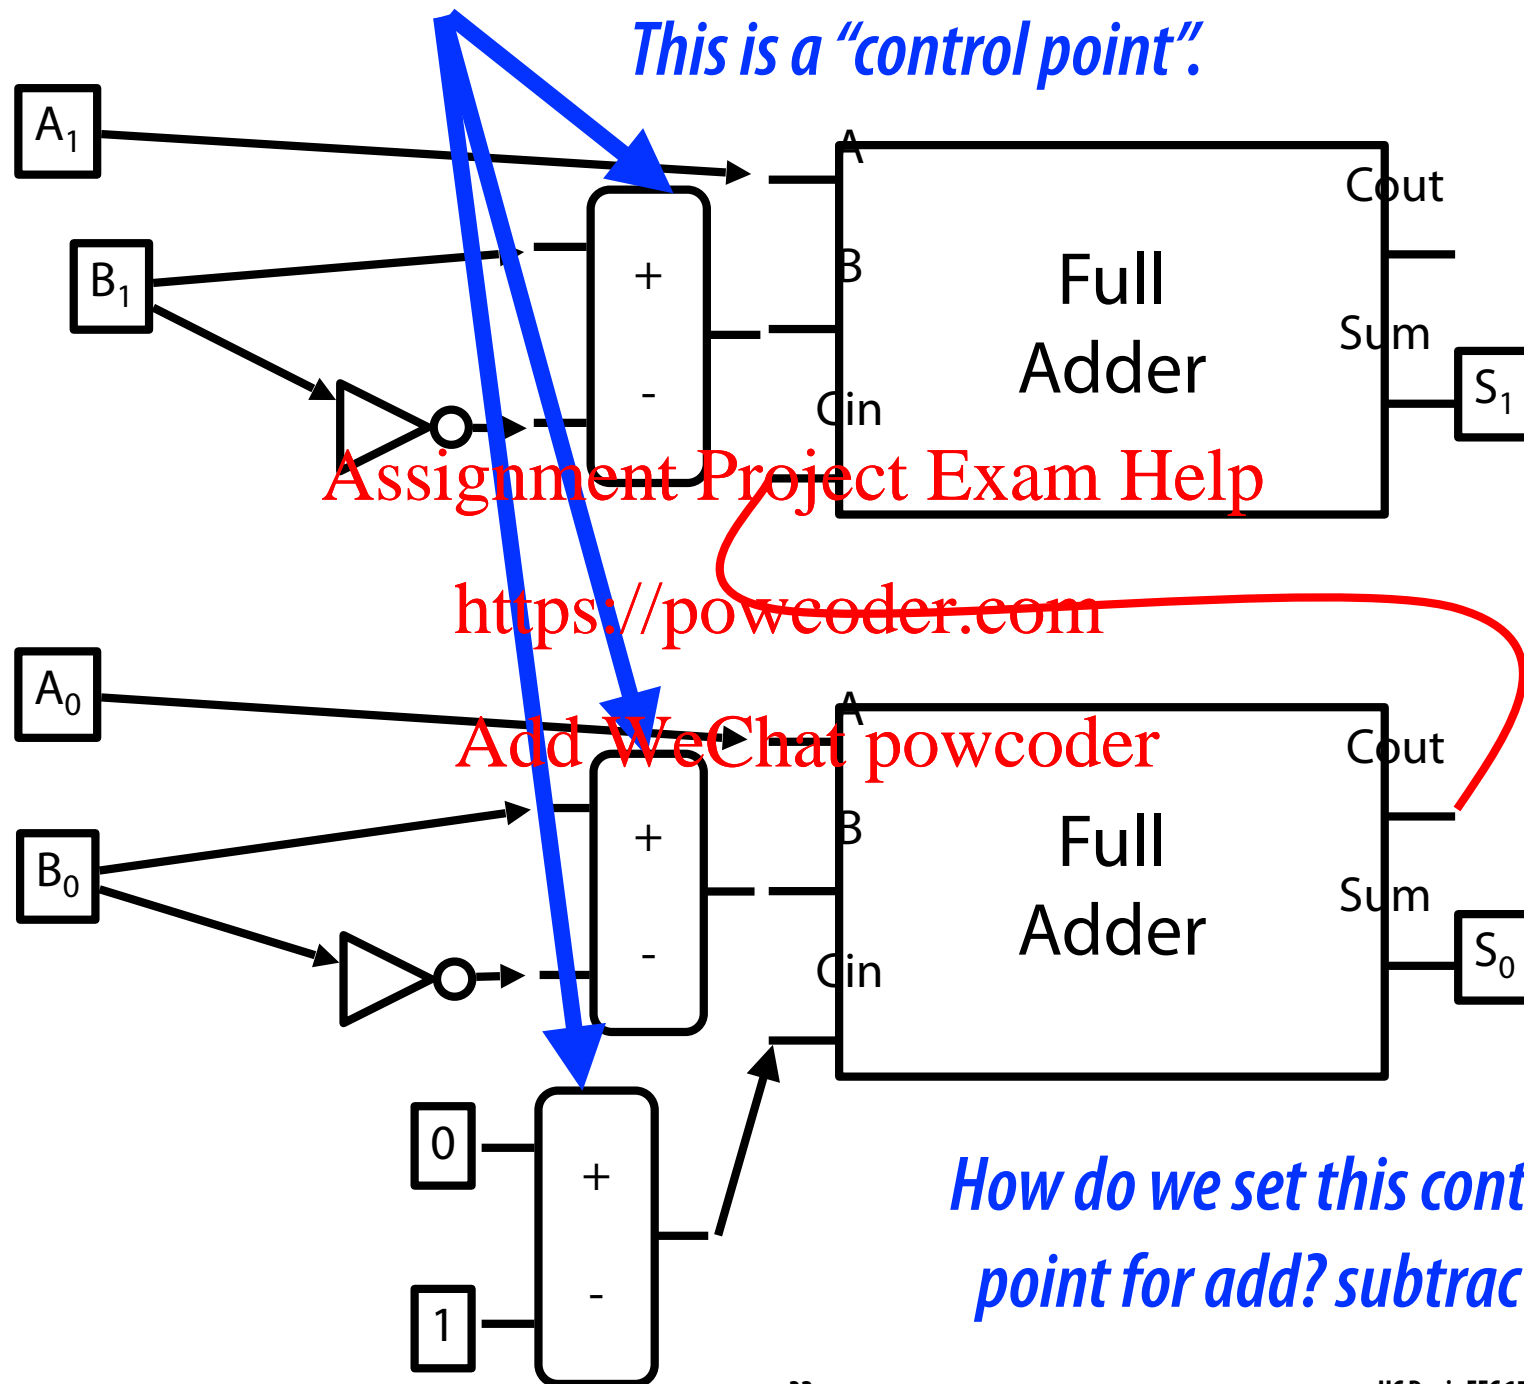

$S = A + \sim B + 1$
... then add 1

Control for +/-

One bit controls three muxes.

This is a "control point".

How do we set this control point for add? subtract?

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

But What About Performance?

- Critical path of one bitslice is CP
- Critical path of n-bit riddled-carry adder is $n \cdot \text{CP}$
- Design Trick:
 - Throw hardware at it

Truth Table for Adder Bit Slice

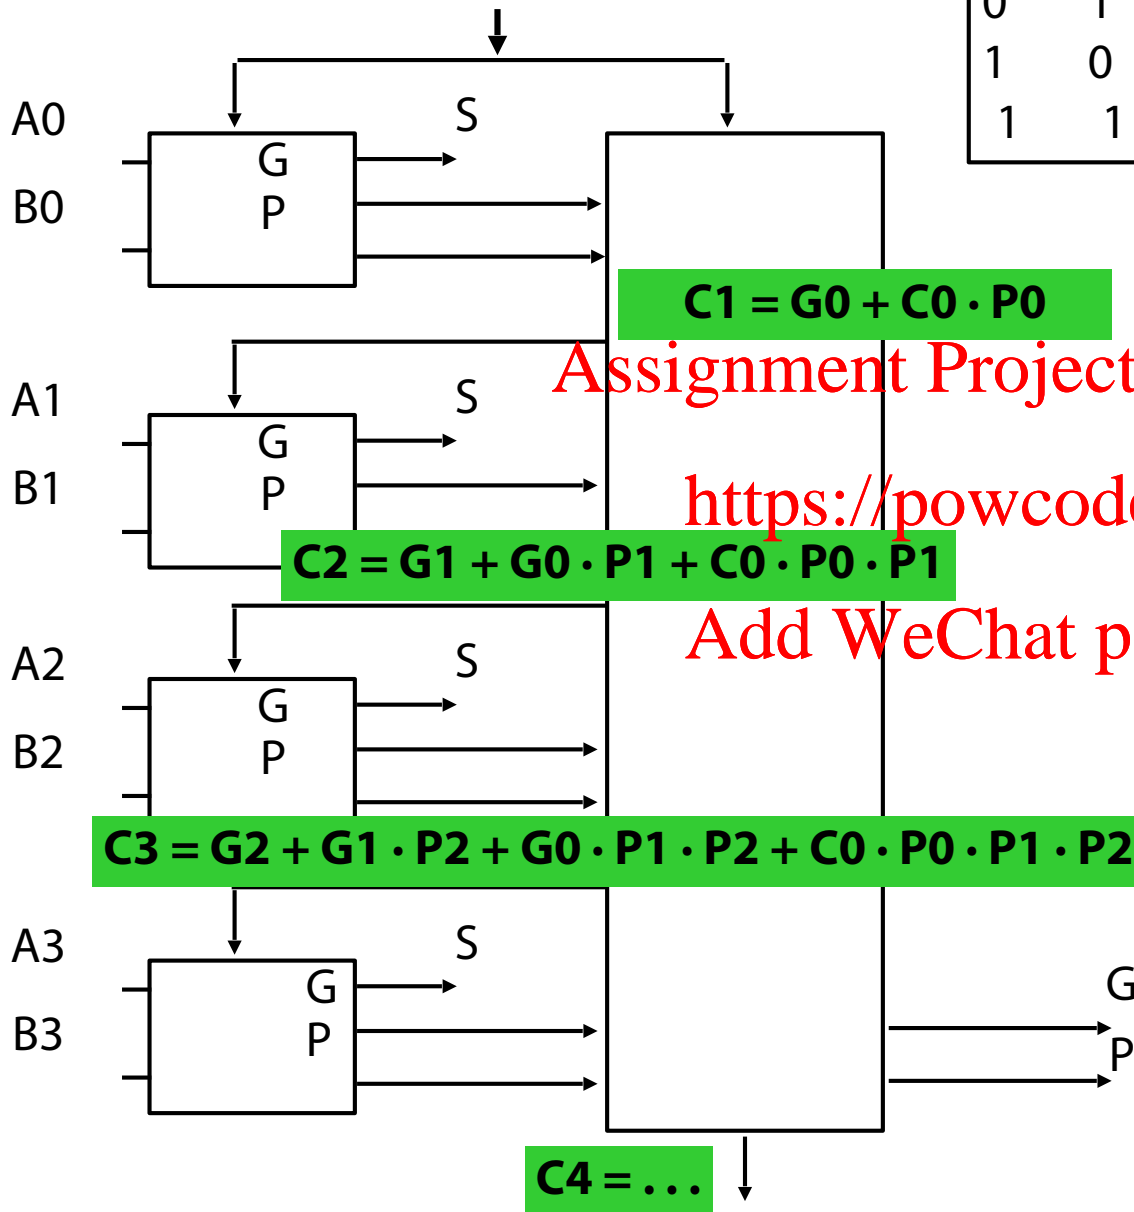

- 3 inputs (A, B, Cin); 2 outputs (Sum, Cout)

A	B	Cin	Sum	Cout
0	0	0	0	0
0	0	1	1	0
0	1	0	1	0=Cin
0	1	1	0	1=Cin
1	0	0	1	0=Cin
1	0	1	0	1=Cin
1	1	0	0	1
1	1	1	1	1

Carry Look Ahead (Design trick: peek)

$$C0 = Cin$$

	A	B	Cin	Cout
0	0	0	0	"kill"
0	1	0	Cin	"propagate"
1	0	0	Cin	"propagate"
1	1	1	1	"generate"

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

G = A and B

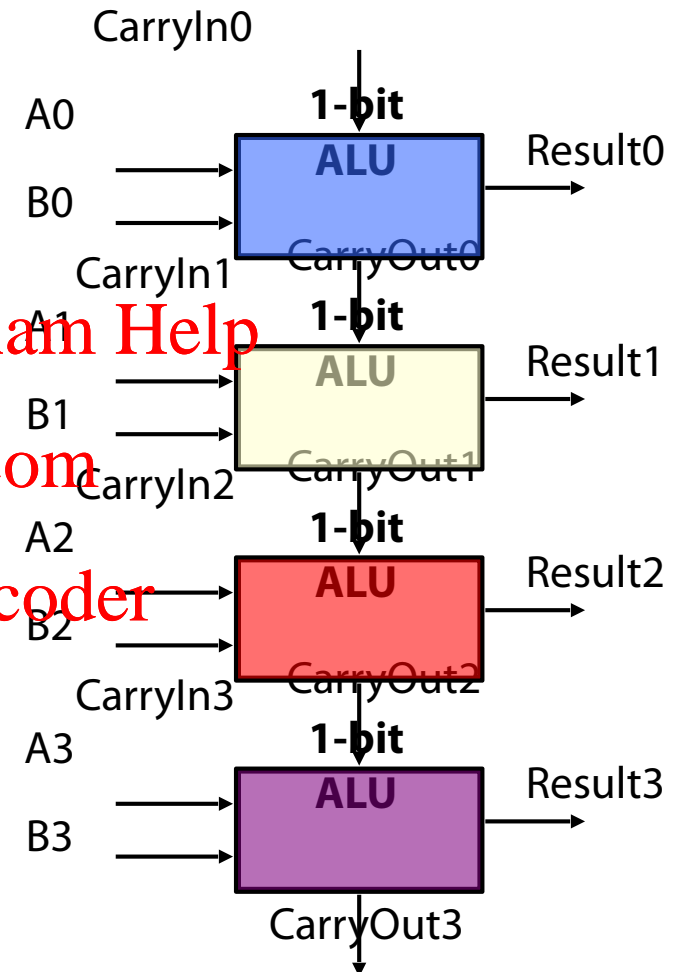

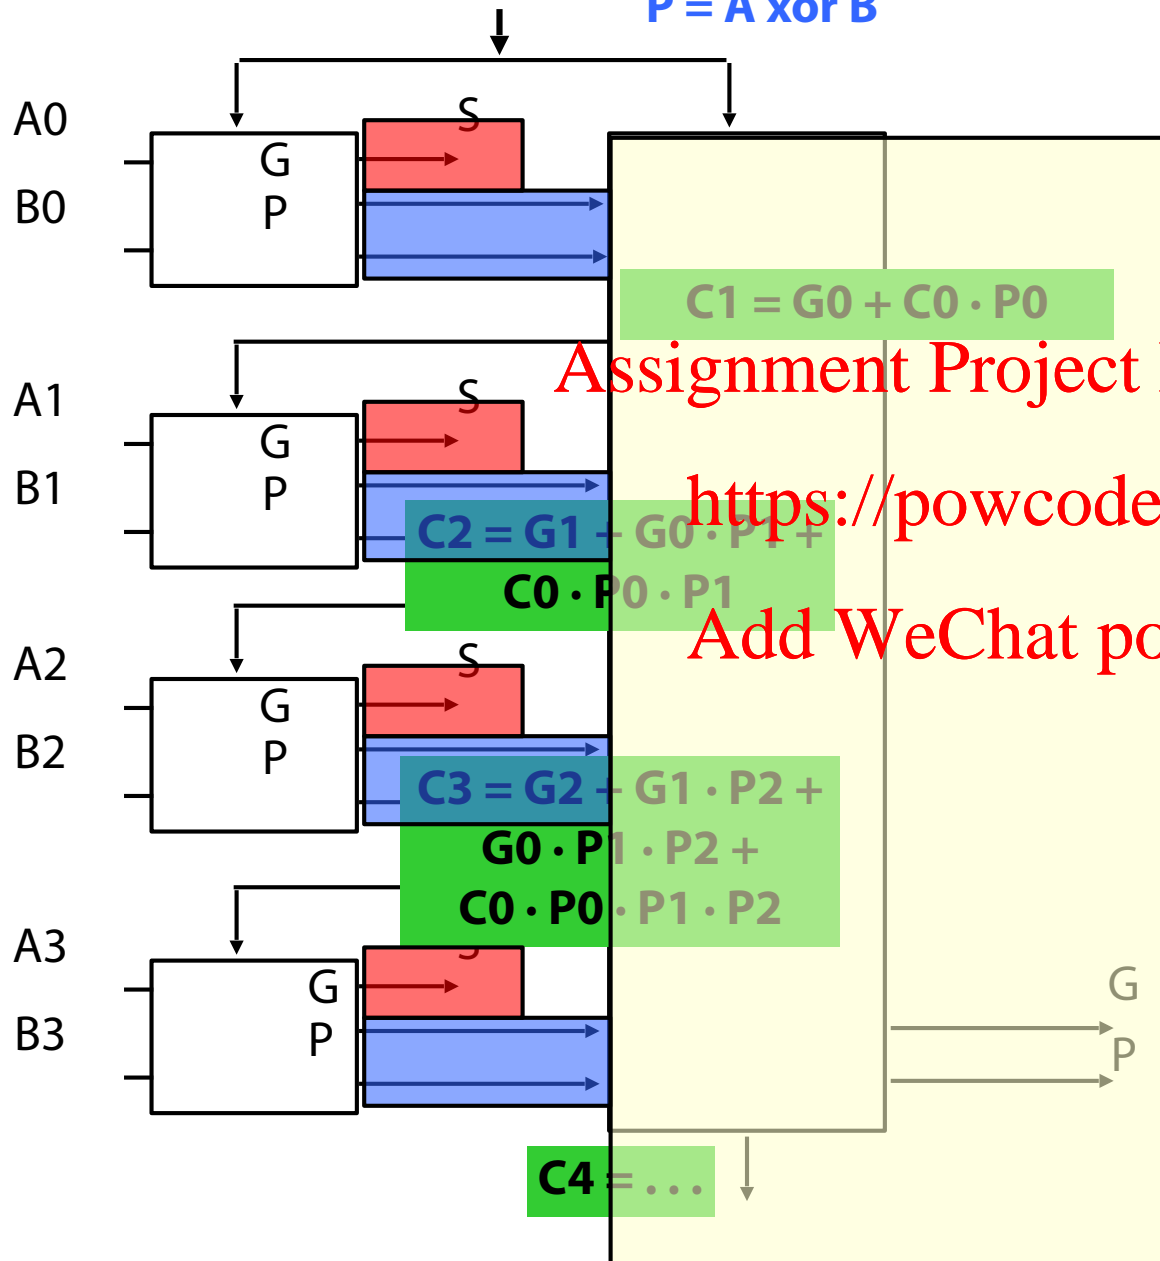

P = A xor B

WHY are these interesting?

CLA vs. Ripple

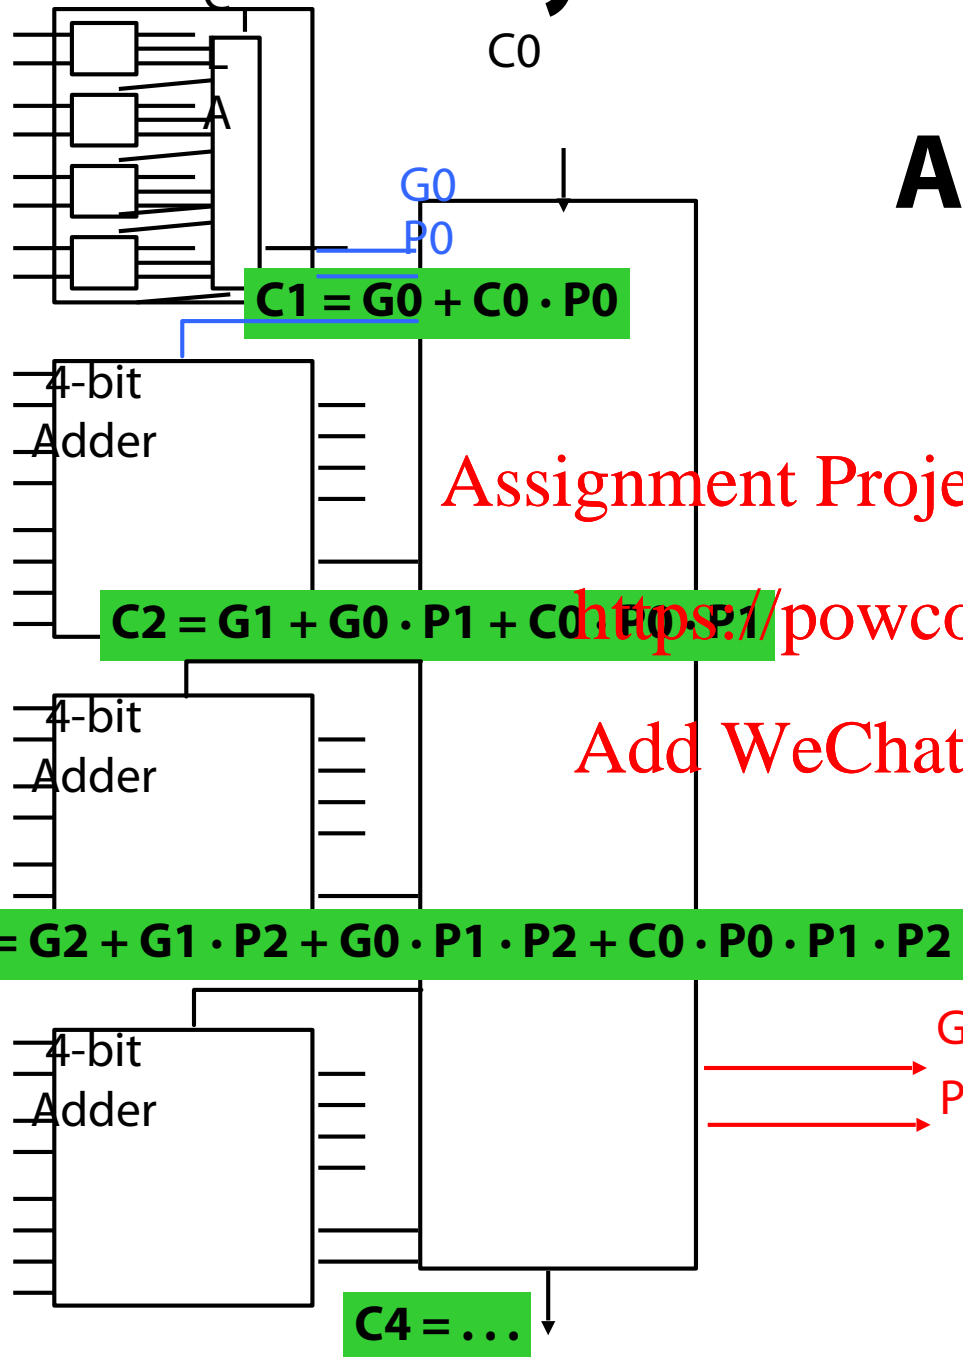

C0 = Cin

G = A and B
P = A xor B

Cascaded Carry Look-ahead (16-bit)

Abstraction!

Design Trick: Guess (or “Precompute”)

$$CP(2n) = 2^*CP(n)$$

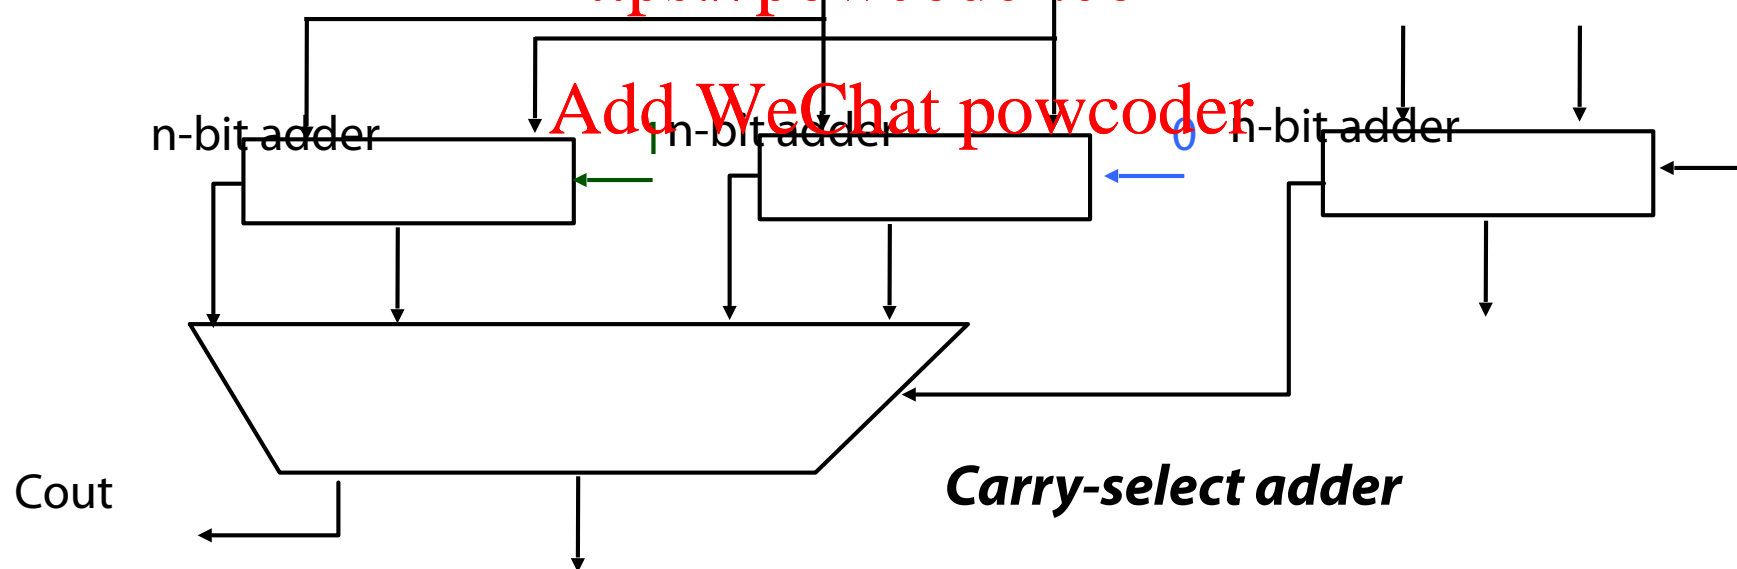

$$P(2n) = CP(n) + CP(\text{mux})$$

Assignment Project Exam Help

Introduction to Computer Architecture

UC Davis EEC 170, Winter 2021

Multiply (unsigned)

■ Paper and pencil example (unsigned):

Multiplicand 1000
Multiplier x 1001
 1000
 0000
 0000
 1000
Product 01001000

Assignment Project Exam Help

<https://powcoder.com>

■ m bits x n bits = m+n bit product

Add WeChat powcoder

■ Binary makes it easy:

- 0 => place 0 (0 x multiplicand)
- 1 => place a copy (1 x multiplicand)

■ 4 versions of multiply hardware & algorithm:

- successive refinement

m bits x n bits = $m+n$ bit product

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

Unsigned Combinational Multiplier

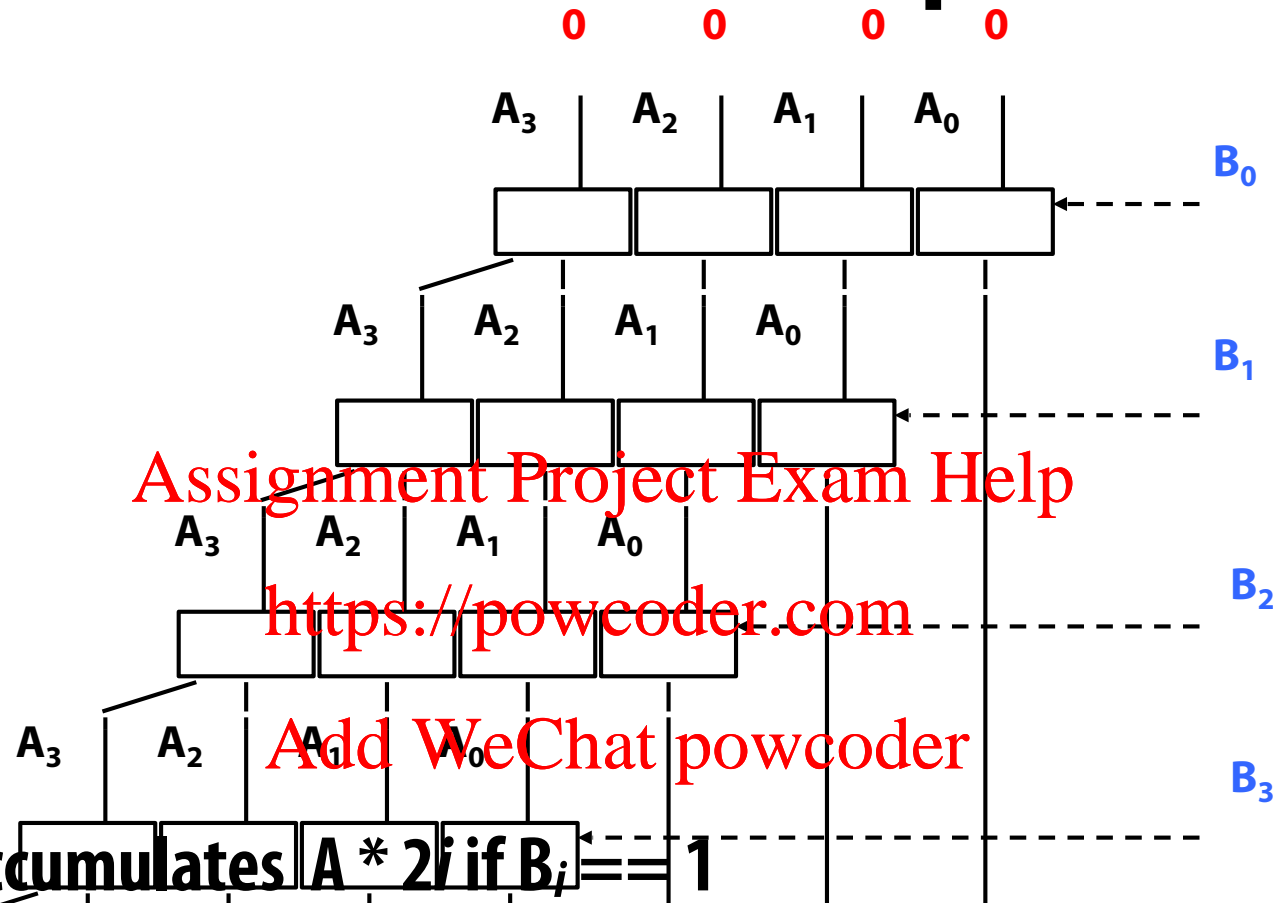

How does it work?

- At each stage shift A left (multiply it by 2)
- Use next bit of B to determine whether to add in shifted multiplicand
- Accumulate $2n$ bit partial product at each stage

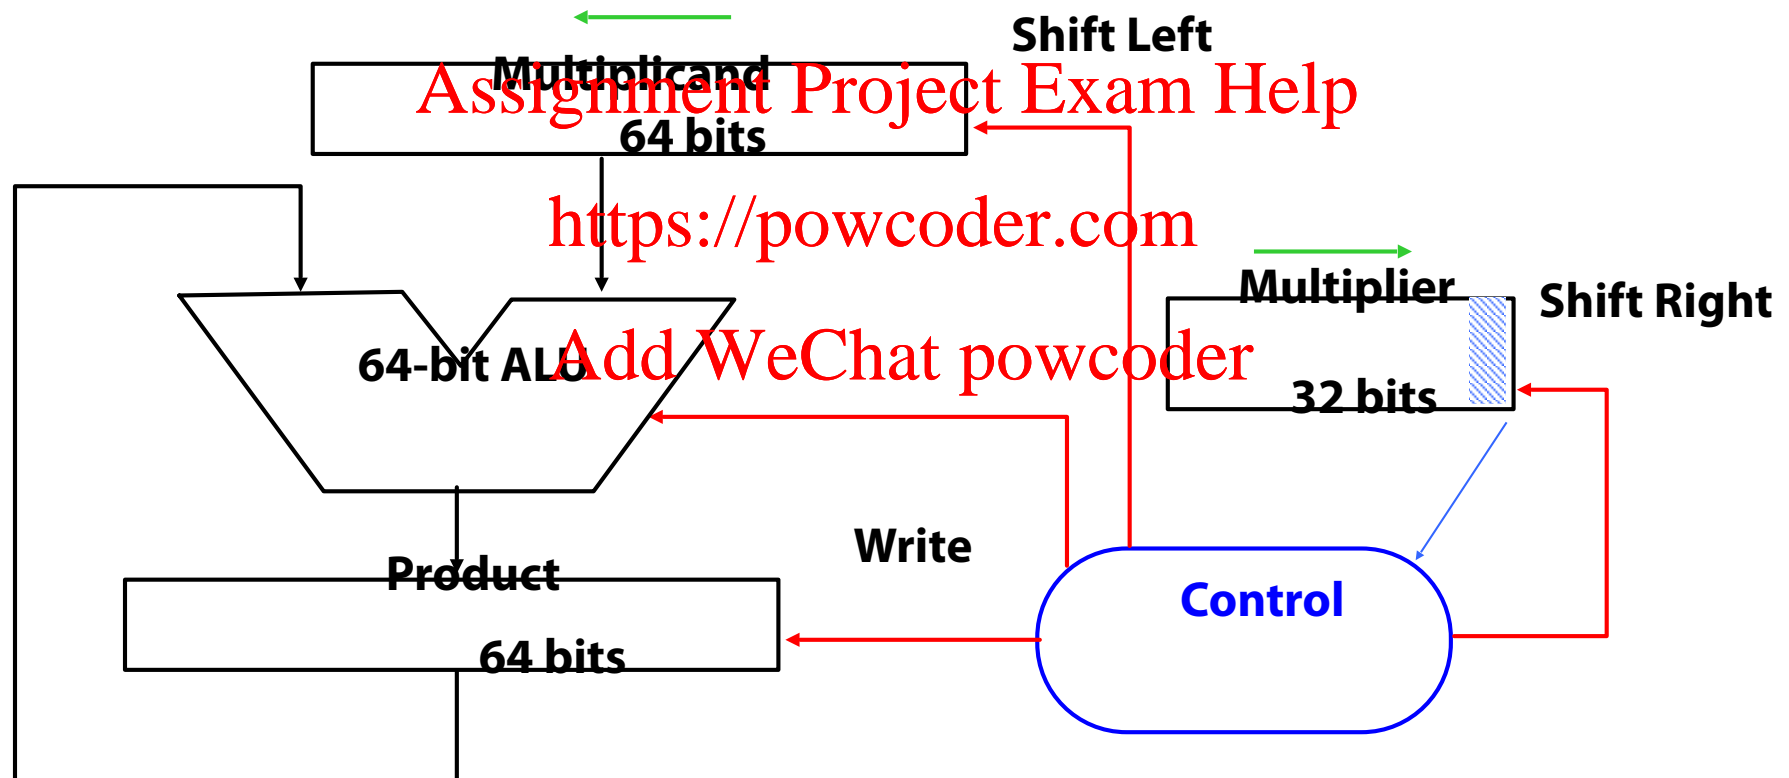

Unsigned Combinational Multiplier

- Stage i accumulates $A * 2^i$ if $B_i = 1$
- Q: How much hardware for 32 bit multiplier? Critical path?

Unsigned shift-add multiplier (version 1)

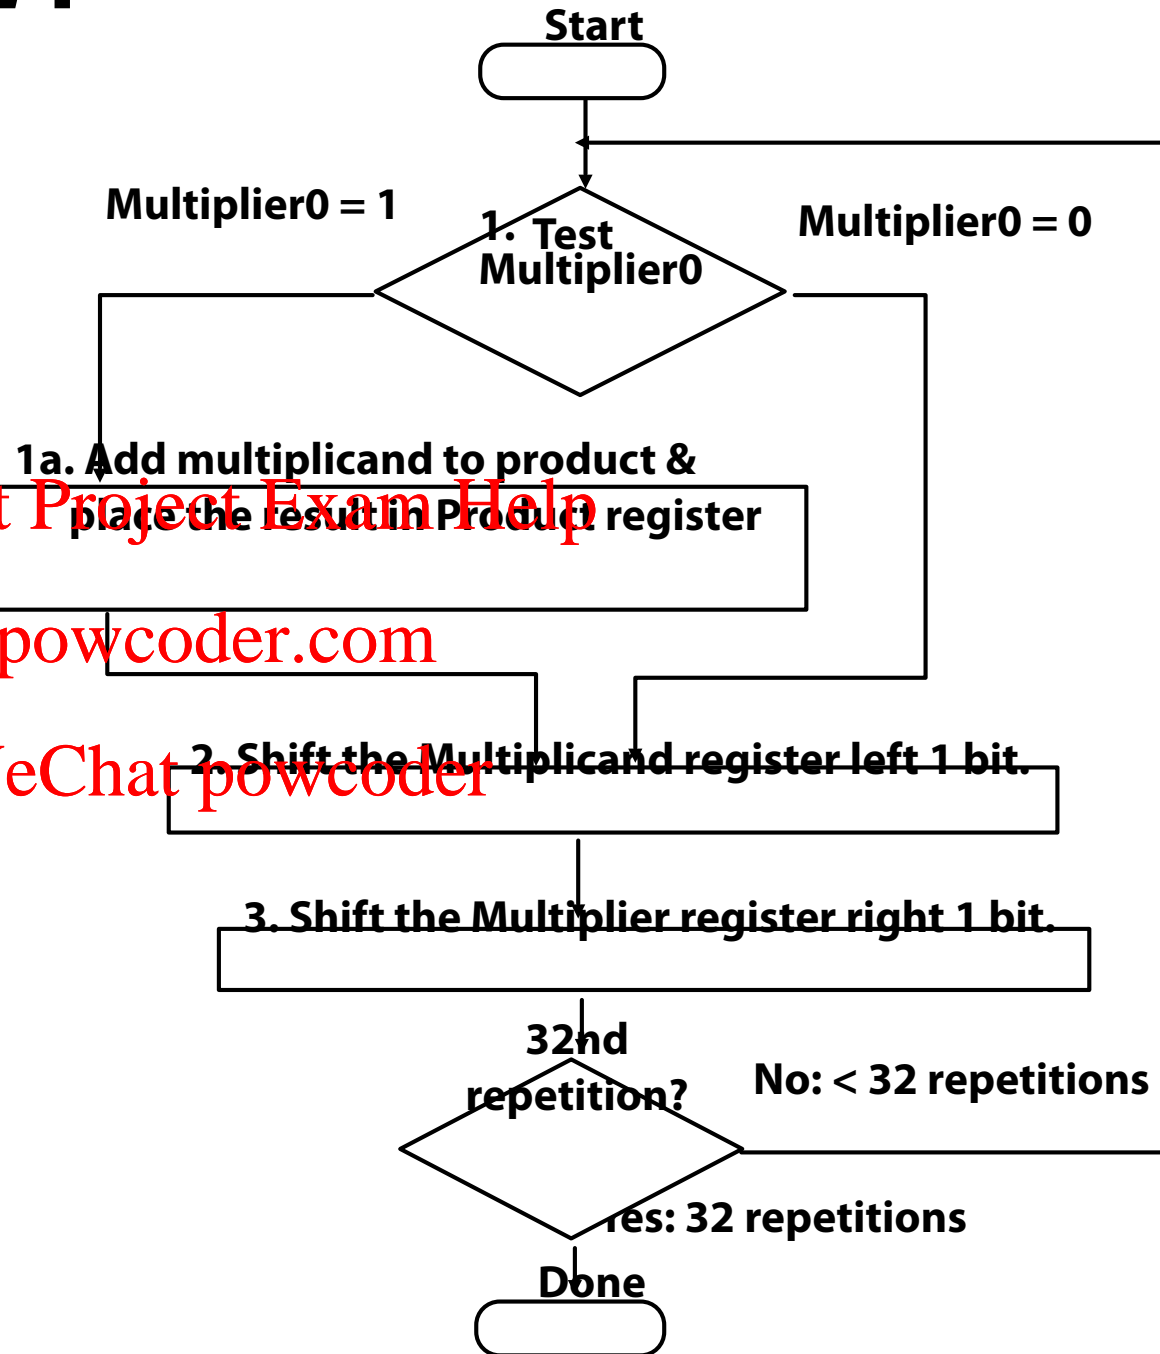

- 64-bit Multiplicand reg, 64-bit ALU, 64-bit Product reg, 32-bit multiplier reg

Multiplier = datapath + control

Multiply Algorithm V1

<u>Product</u>	<u>Multiplier</u>	<u>Multiplicand</u>
0000 0000	0011	0000 0010
1:0000 0010	0011	0000 0010
2:0000 0010	0011	0000 0100
3:0000 0010	0001	0000 0100
1:0000 0110	0001	0000 0100
2:0000 0110	0001	0000 1000
3:0000 0110	0000	0000 1000
0000 0110	0000	0000 1000

Observations on Multiply Version 1

- 1 clock per cycle $\Rightarrow \approx 100$ clocks per multiply
 - Ratio of multiply to add 5:1 to 100:1
- 1/2 bits in multiplicand always 0
 - \Rightarrow 64-bit adder is wasted
- 0's inserted in right of multiplicand as shifted
 - \Rightarrow least significant bits of product never changed once formed
- *Instead of shifting multiplicand to left, shift product to right?*

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

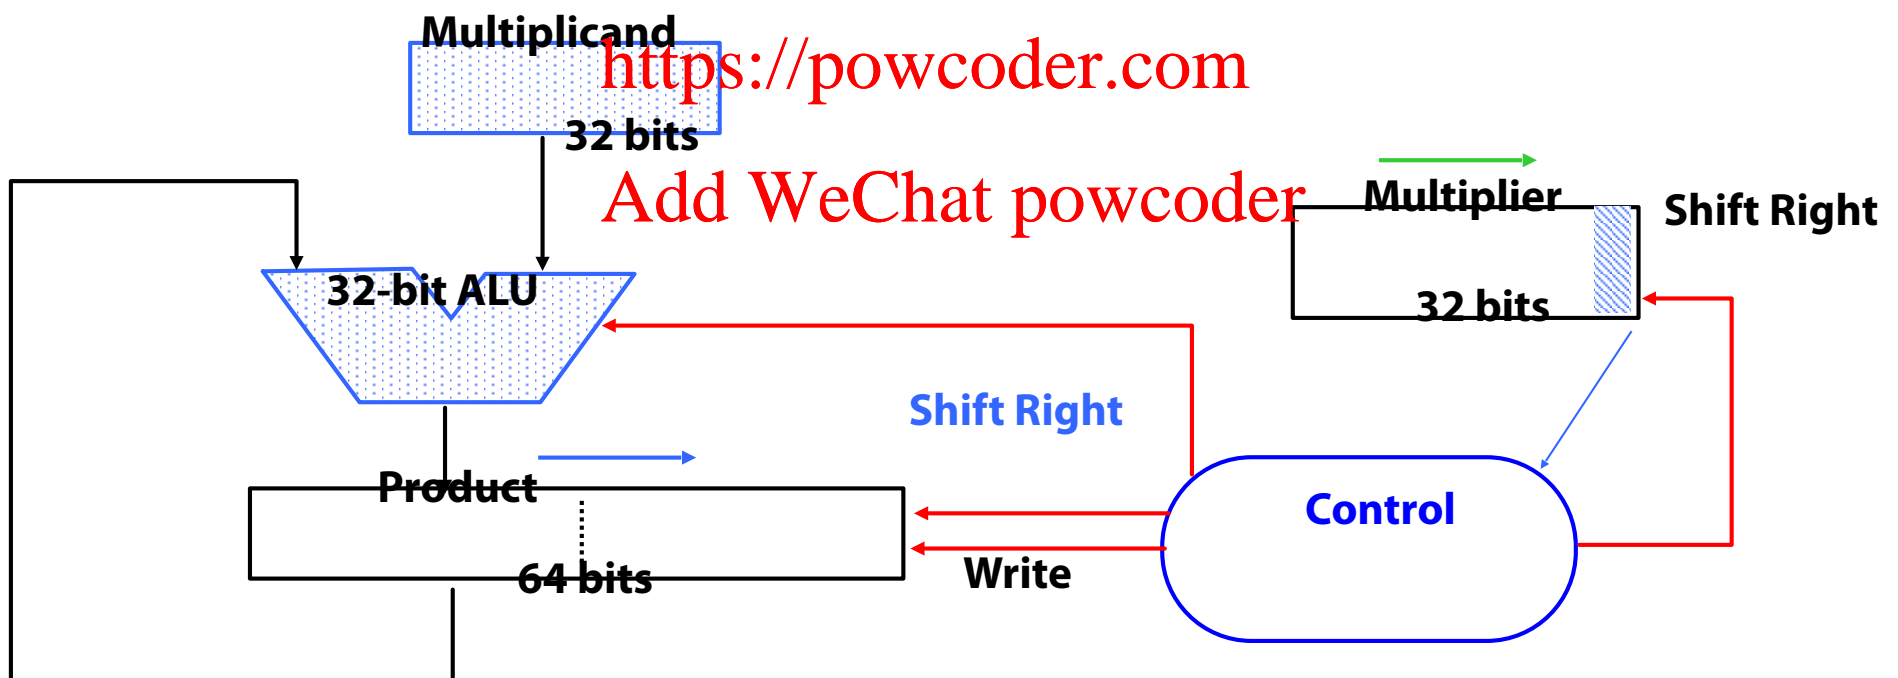

Multiply Hardware Version 2

- **32-bit** Multiplicand reg, **32-bit** ALU, 64-bit Product reg, 32-bit Multiplier reg

Assignment Project Exam Help

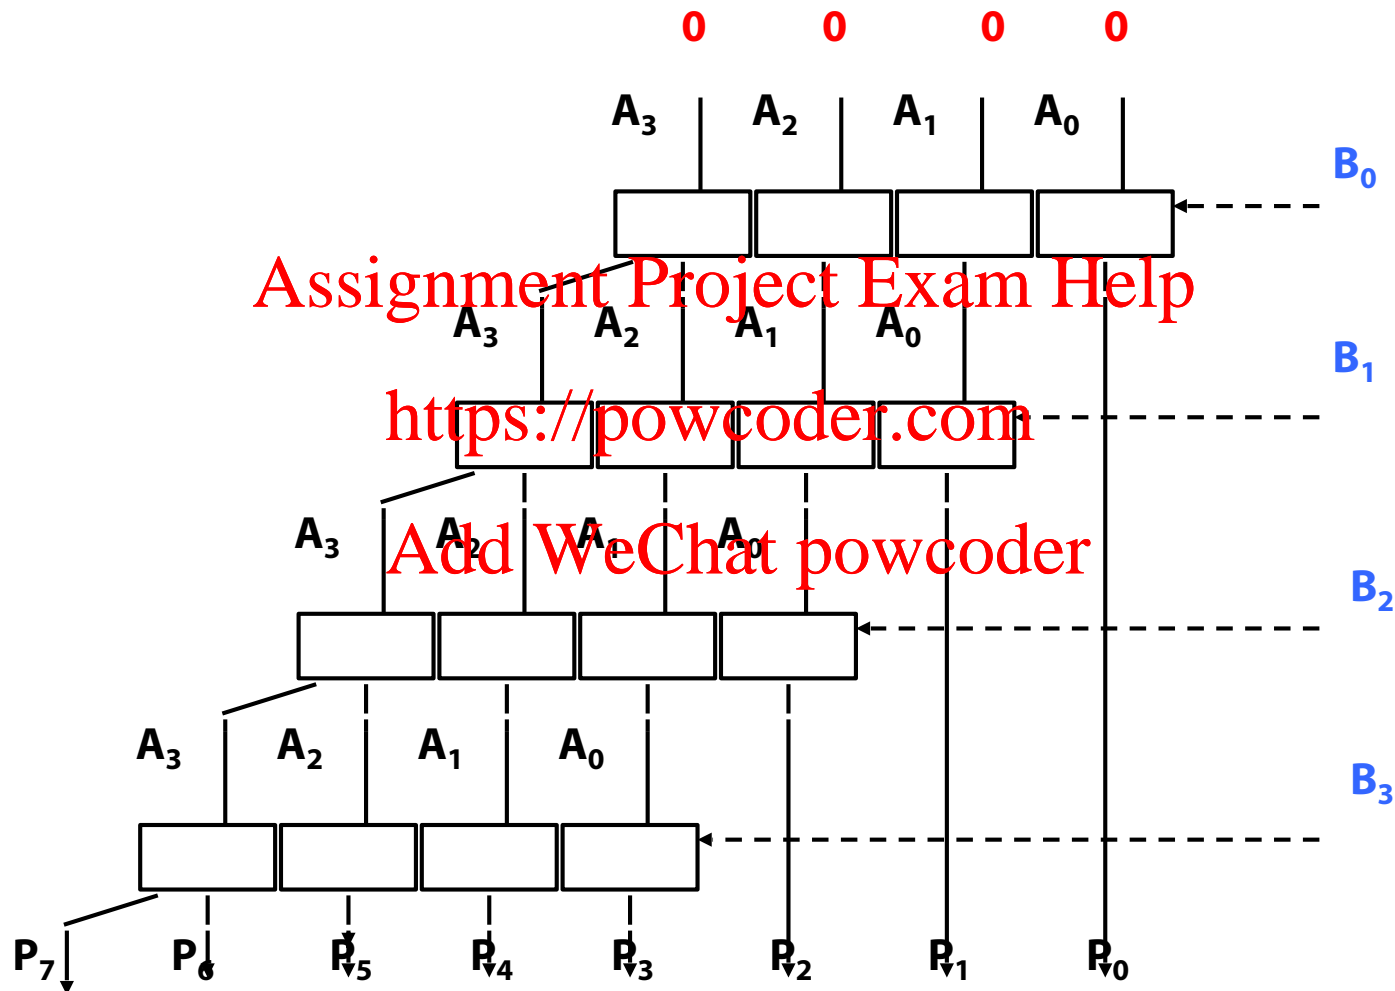

<https://powcoder.com>

Add WeChat powcoder

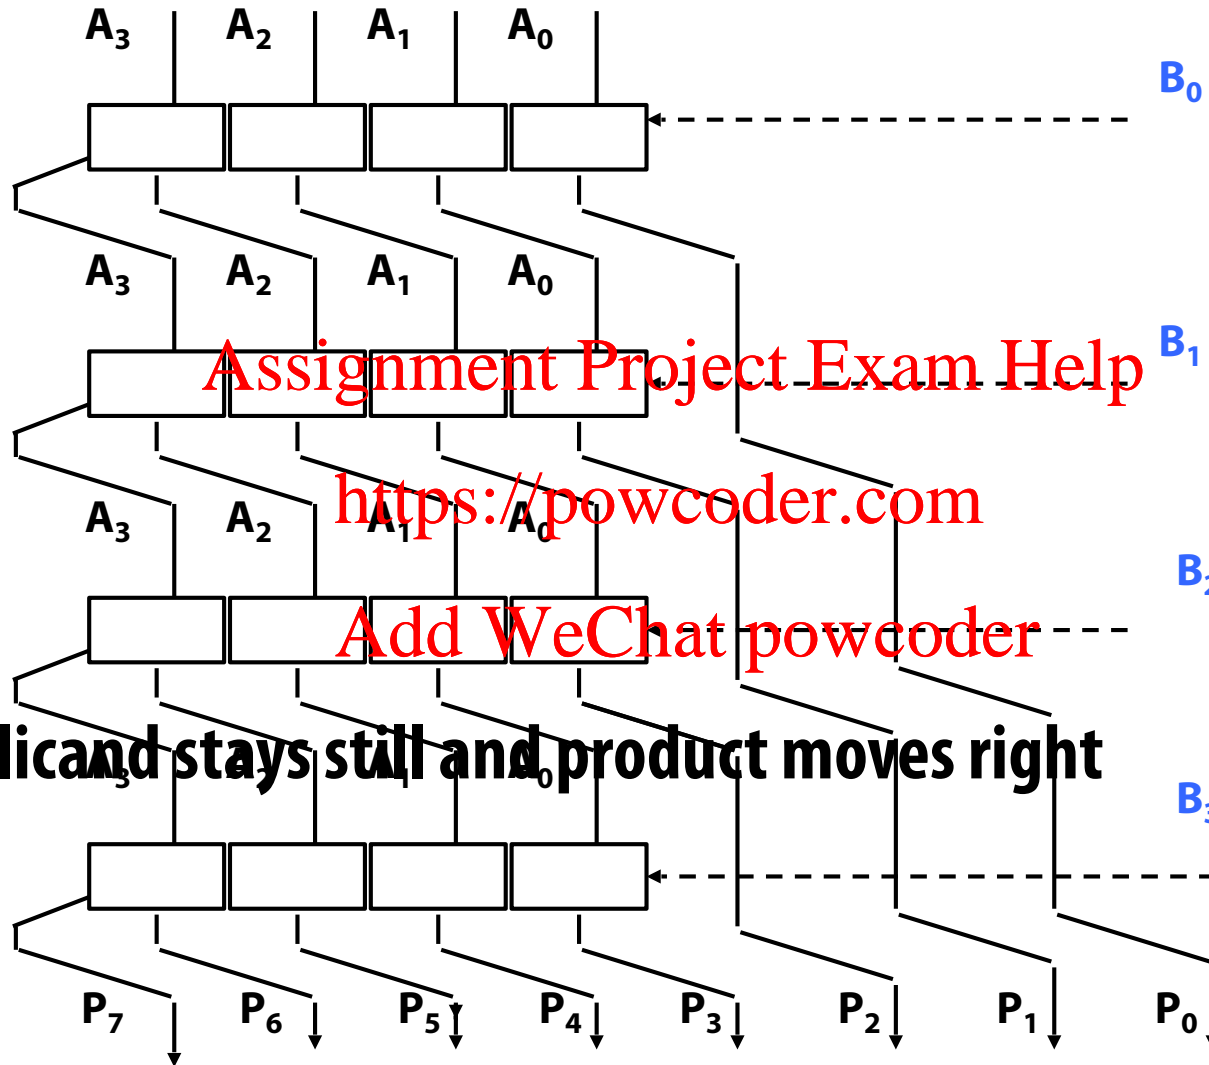

How to think of this?

- Remember original combinational multiplier:

Simply warp to let product move right...

0 0 0 0

- Multiplicand stays still and product moves right

Multiply Algorithm V2

	Product	Multiplier	Multiplicand
	0000 0000	0011	0010
1:	0010 0000	0011	0010
2:	0001 0000	0011	0010
3:	0001 0000	0011	0010
1:	0011 0000	0001	0010
2:	0001 1000	0001	0010
3:	0001 1000	0000	0010
1:	0001 1000	0000	0010
2:	0000 1100	0000	0010
3:	0000 1100	0000	0010
1:	0000 1100	0000	0010
2:	0000 0110	0000	0010
3:	0000 0110	0000	0010
	0000 0110	0000	0010

1. Add multiplicand to the left half of product & place the result in the left half of Product register

<https://powcoder.com>

Add WeChat powcoder

Multiplier0 = 1

Start

1. Test Multiplier0

Multiplier0 = 0

2. Shift the Product register right 1 bit.

3. Shift the Multiplier register right 1 bit.

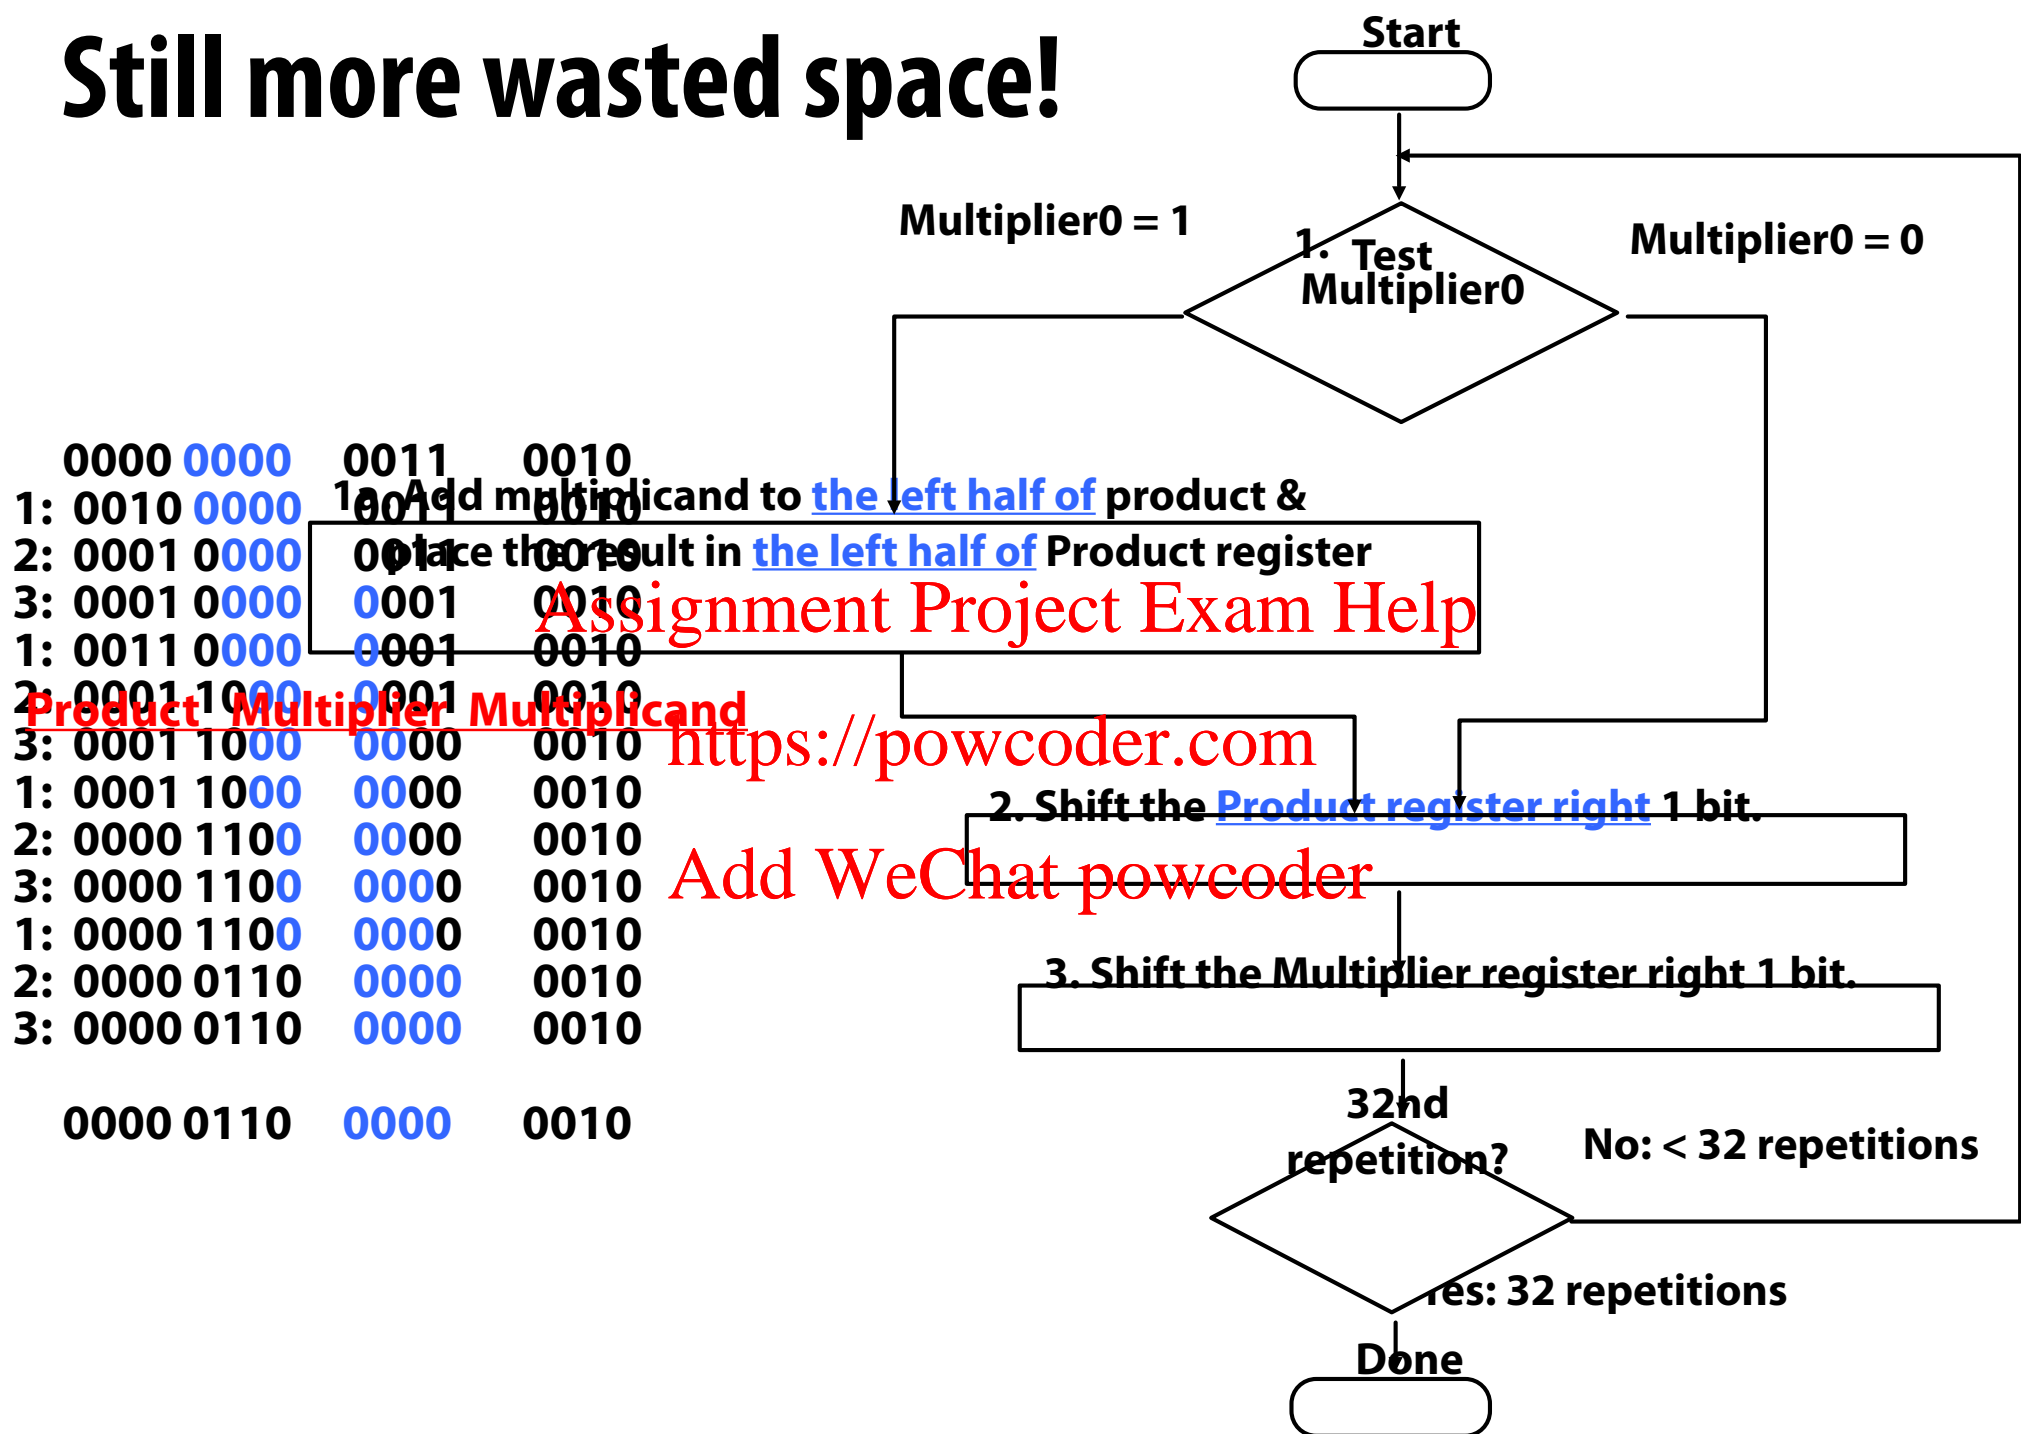

32nd repetition?

No: < 32 repetitions

Yes: 32 repetitions

Done

Still more wasted space!

Observations on Multiply Version 2

- Product register wastes space that exactly matches size of multiplier
=> combine Multiplier register and Product register

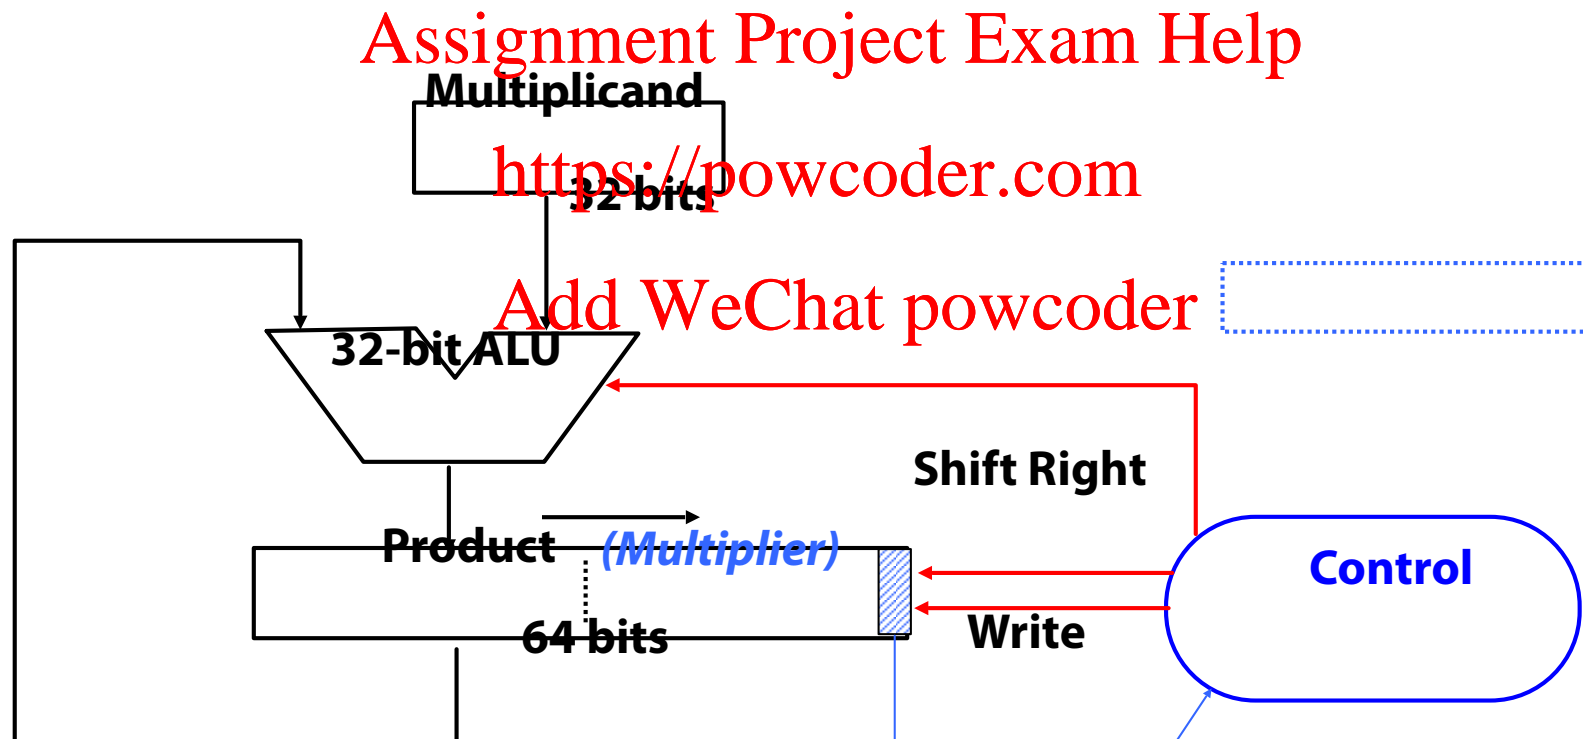

Assignment Project Exam Help

<https://powcoder.com>

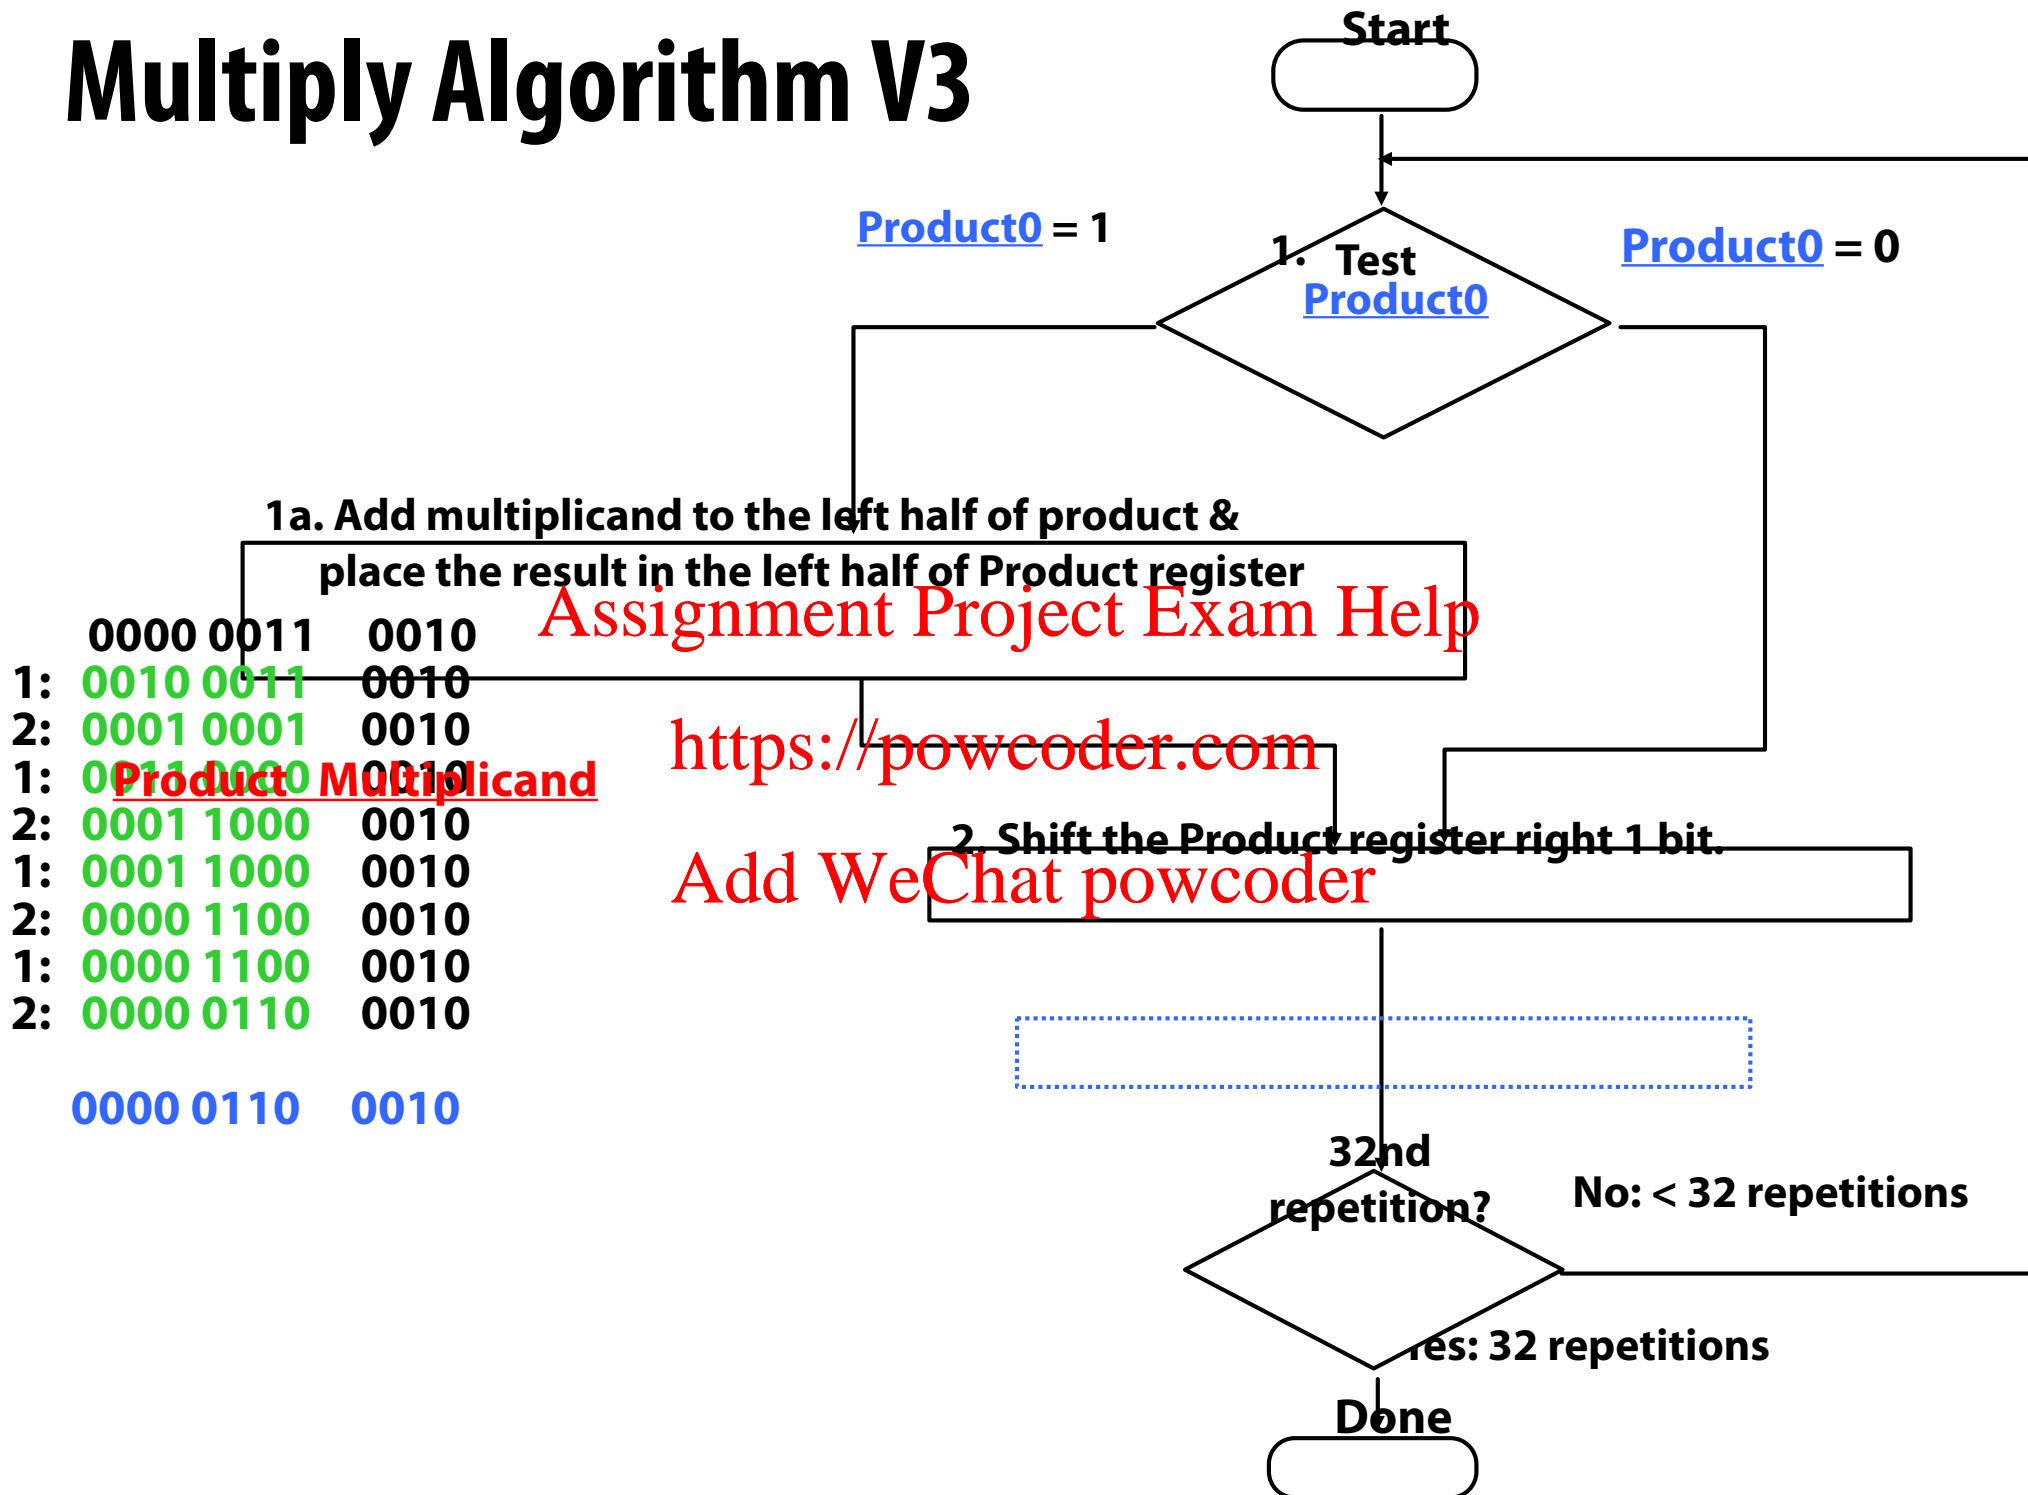

Add WeChat powcoder

Multiply Hardware Version 3

- 32-bit Multiplicand reg, 32-bit ALU, 64-bit Product reg, (0-bit Multiplier reg)

Multiply Algorithm V3

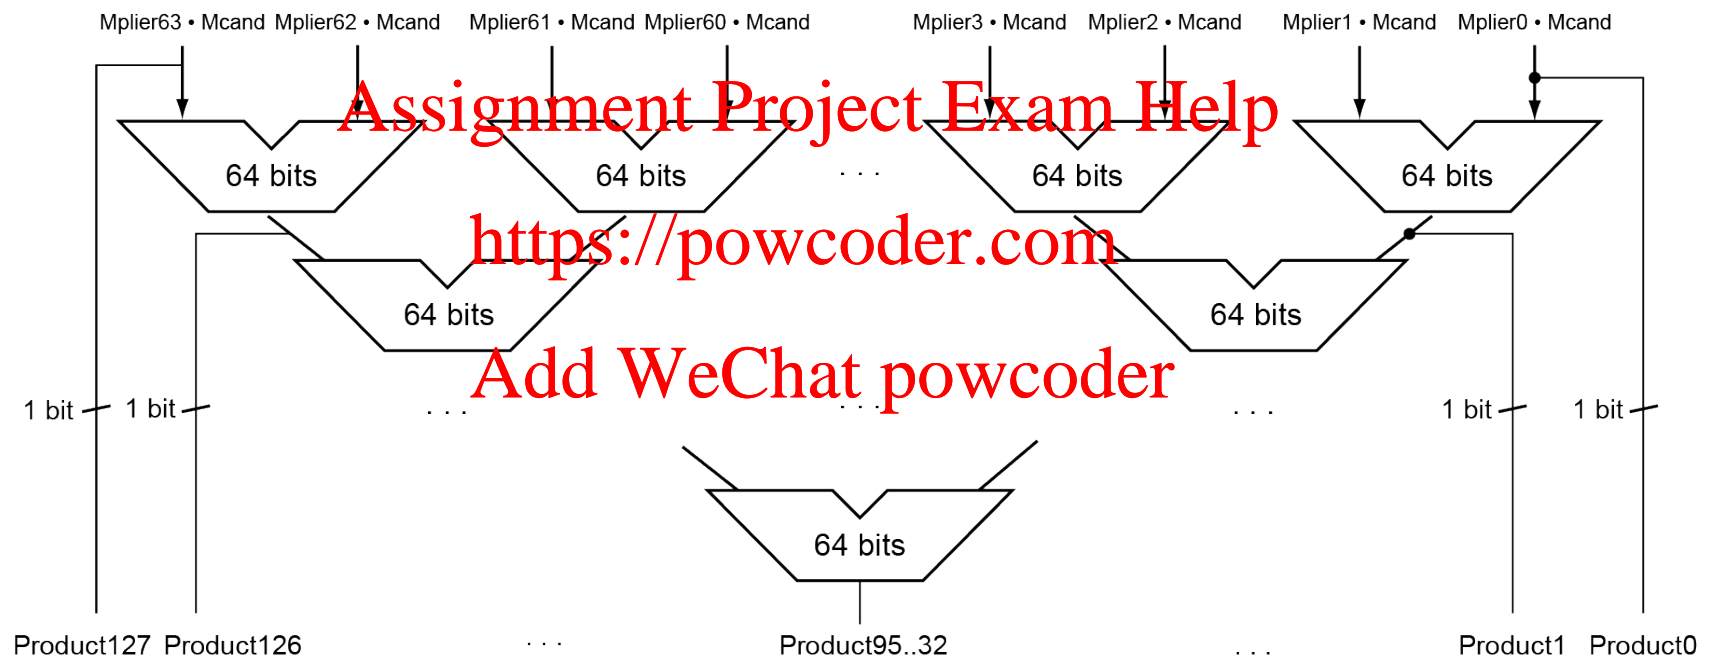

Observations on Multiply Version 3

- 2 steps per bit because Multiplier & Product combined
- What about signed multiplication?
 - easiest solution is to make both positive & remember whether to complement product when done (leave out the sign bit, run for 31 steps)
<https://powcoder.com>
 - apply definition of 2's complement
[Add WeChat powcoder](#)
 - need to sign-extend partial products and subtract at the end
 - Booth's Algorithm is elegant way to multiply signed numbers using same hardware as before and save cycles
 - can handle multiple bits at a time

Faster Multiplier

- Uses multiple adders
 - Cost/performance tradeoff

- Can be pipelined
 - Several multiplications performed in parallel

Motivation for Booth's Algorithm

■ Example $2 \times 6 = 0010 \times 0110$:

■

	0010	
x	0110	
<hr/>		
+	0000	shift (0 in multiplier)
+	0010	add (1 in multiplier)
+	0010	add (1 in multiplier)
+	0000	shift (0 in multiplier)
<hr/>		
	0001100	

Assignment Project Exam Help
<https://powcoder.com>
 Add WeChat powcoder

Motivation for Booth's Algorithm

- ALU with add or subtract can get same result in more than one way:

- $6 = 4 + 2 = -2 + 8$

$$0110 = -00010 + 01000 = 11110 + 01000$$

- For example:

	0010	(2 [multiplier])
x	0110	(6 [multiplicand])
<hr/>		
	0000	shift (0 in multiplier)
-	0010	sub (first 1 in multpl.)
	0000	shift (mid string of 1s)
+	0010	add (prior step had last 1)
<hr/>		
	00001100	

Assignment Project Exam Help

Add WeChat powcoder

Booth's Algorithm

Current Bit	Bit to the Right	Explanation	Beginning Example	Op
1	0	Begins run of 1s	0001111000	
sub				
1	1	Middle of run of 1s	0001111000	none
0	1	End of run of 1s	0001111000	add
0	0	Middle of run of 0s	0001111000	none

<https://powcoder.com>

- Originally for speed (when shift was faster than add)
- Replace a string of 1s in multiplier with an initial subtract when we first see a one and then later add for the bit after the last one
- Handles two's complement!

Booth's Example (2 x 7)

Operation	Multiplicand	Product	next?
0. initial value	0010	0000 0111 0	10 -> sub
1a. $P = P - m$	0010 + 1110->	1110 0111 0	shift P (sign ext)
1b.	0010	1111 0011 1	11 -> nop, shift
2.	0010	1111 1001 1	11 -> nop, shift
3.	0010	1111 1100 1	01 -> add
4a.	0010 + 0010->	0001 1100 1	shift
4b.	0010	0000 1110 0	done

Blue + red = multiplier (red is 2 bits to compare); Green = arithmetic ops; Black = product

Booth's Example (2 x -3)

Operation	Multiplicand	Product	next?
0. initial value	0010	0000 1101 0	10 -> sub
1a. P = P - m	1110 + 1110	1110 1101 0	shift P (sign ext)
1b.	0010	1111 0110 1	01 -> add
2a.		0001 0110 1	shift P
2b.	0010	0000 1011 0	10 -> sub
3a.	0010	1110 1011 0	shift
3b.	0010	1111 0101 1	11 -> nop
4a.		1111 0101 1	shift
4b.	0010	1111 1010 1	done

Blue + red = multiplier (red is 2 bits to compare); Green = arithmetic ops; Black = product

Radix-4 Modified Booth's Algorithm

Current Bits	Bit to the Right	Explanation	Example	Recode
0 0	0	Middle of zeros	00 00 00 <u>00</u> 00	0
0 1	0	Single one	00 00 00 <u>01</u> 00	1
1 0	0	Begins run of 1s	00 01 11 <u>10</u> 00	-2
1 1	0	Begins run of 1s	00 01 11 <u>11</u> 00	-1
<p>Assignment Project Exam Help</p> <p>https://powcoder.com</p> <p>Add WeChat powcoder</p>				
0 0	1	Ends run of 1s	00 <u>00</u> 11 11 00	1
0 1	1	Ends run of 1s	00 <u>01</u> 11 11 00	2
1 0	1	Isolated 0	00 11 <u>10</u> 11 00	-1
1 1	1	Middle of run	00 11 <u>11</u> 11 00	0

Same insight as one-bit Booth's, simply adjust for alignment of 2 bits.

Allows multiplication 2 bits at a time.

RISC-V Multiplication Support

■ Four multiply instructions:

- **mul: multiply**
 - Gives the lower 64 bits of the product
- **mulh: multiply high**
 - Gives the upper 64 bits of the product, assuming the operands are signed
- **mulhu: multiply high unsigned**
 - Gives the upper 64 bits of the product, assuming the operands are unsigned
- **mulhsu: multiply high signed/unsigned**
 - Gives the upper 64 bits of the product, assuming one operand is signed and the other unsigned
- Use mulh result to check for 64-bit overflow

Add WeChat powcoder

RISC-V Support for multiply

- “If both the high and low bits of the same product are required, then the recommended code sequence is: `MULH[[S]U] rdh, rs1, rs2; MUL rd1, rs1, rs2` (source register specifiers must be in same order and `rdh` cannot be the same as `rs1` or `rs2`). Microarchitectures can then fuse these into a single multiply operation instead of performing two separate multiplies.”

Is NVIDIA Doubling Down On RISC-V?

- “Six RISC-V positions have been advertised by NVIDIA, based in Shanghai and pertaining to architecture, design, and verification.”
- “Due its light weight and extensibility, RISC-V is gaining mainstream adoption across many new sectors, including datacenter accelerators, mobile & wireless, automotive, and IoT.”
- “In a 2017 RISC-V workshop in Shanghai, NVIDIA explained that shortcomings such as low performance and lack of caches and thread protection meant Falcon’s architecture could not meet growing complexity demands.”
- “NVIDIA listed the technical criteria for its next-gen architecture: more than twice the performance of Falcon, less than twice the area cost of Falcon, support for caches, tightly coupled memories, 64-bit addresses, and suitability for modern operating systems. They concluded only RISC-V meets all criteria. The new RISC-V micro-controllers will outperform Falcon micro-controllers by three times, Tom’s Hardware has reported.”

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

RISC-V Support for divide

■ 4 instructions:

- {div, divu, rem, remu} rd, rs1, rs2
- div: rs1 / rs2, treat as signed
- divu: rs1 / rs2, treat as unsigned
- rem: rs1 mod rs2, treat as signed
- remu: rs1 mod rs2, treat as unsigned

- ## ■ “If both the quotient and remainder are required from the same division, the recommended code sequence is: DIVU rdq, rs1, rs2; REMU rdr, rs1, rs2 (rdq cannot be the same as rs1 or rs2). Microarchitectures can then fuse these into a single divide operation instead of performing two separate divides.”

■ Overflow and division-by-zero don't produce errors

- Just return defined results
- Faster for the common case of no error

MIPS Support for multiply/divide

- Rather than target the general-purpose registers:
 - mul placed its output into two special hi and lo registers
 - div placed its divide output into lo and its rem output into hi
 - MIPS provided mflo and mghi instructions (destination: general-purpose register)

- See how big a number can be subtracted, creating quotient bit on each step
 - Binary $\Rightarrow 1 * \text{divisor}$ or $0 * \text{divisor}$
- Dividend = Quotient x Divisor + Remainder
- 3 versions of divide, successive refinement

Divide Hardware Version 1

- 64-bit Divisor reg, 64-bit ALU, 64-bit Remainder reg, 32-bit Quotient reg

Divide Algorithm V1

- Takes $n+1$ steps for n -bit Quotient & Rem.

- Remainder Quotient Divisor

0000 0111 0000 0010 0000

2a. Shift the Quotient register to the left, setting the new rightmost bit to 1.

2b. Restore the original value by adding the Divisor register to the Remainder register, & place the sum in the Remainder register. Also shift the Quotient register to the left, setting the new least significant bit to 0.

3. Shift the Divisor register right 1 bit.

$n+1$ repetition?

No: $< n+1$ repetitions

Yes: $n+1$ repetitions ($n = 4$ here)

Done

Start: Place Dividend in Remainder

1. Subtract the Divisor register from the Remainder register, and place the result in the Remainder register.

Test
Remainder
Remainder ≥ 0 Remainder < 0

<https://powcoder.com>

Add WeChat powcoder

Divide Hardware Version 2

- **32-bit Divisor reg, 32-bit ALU, 64-bit Remainder reg, 32-bit Quotient reg**

Divide Algorithm V2

Remainder	Quotient	Divisor
0000	0111	0000 0010

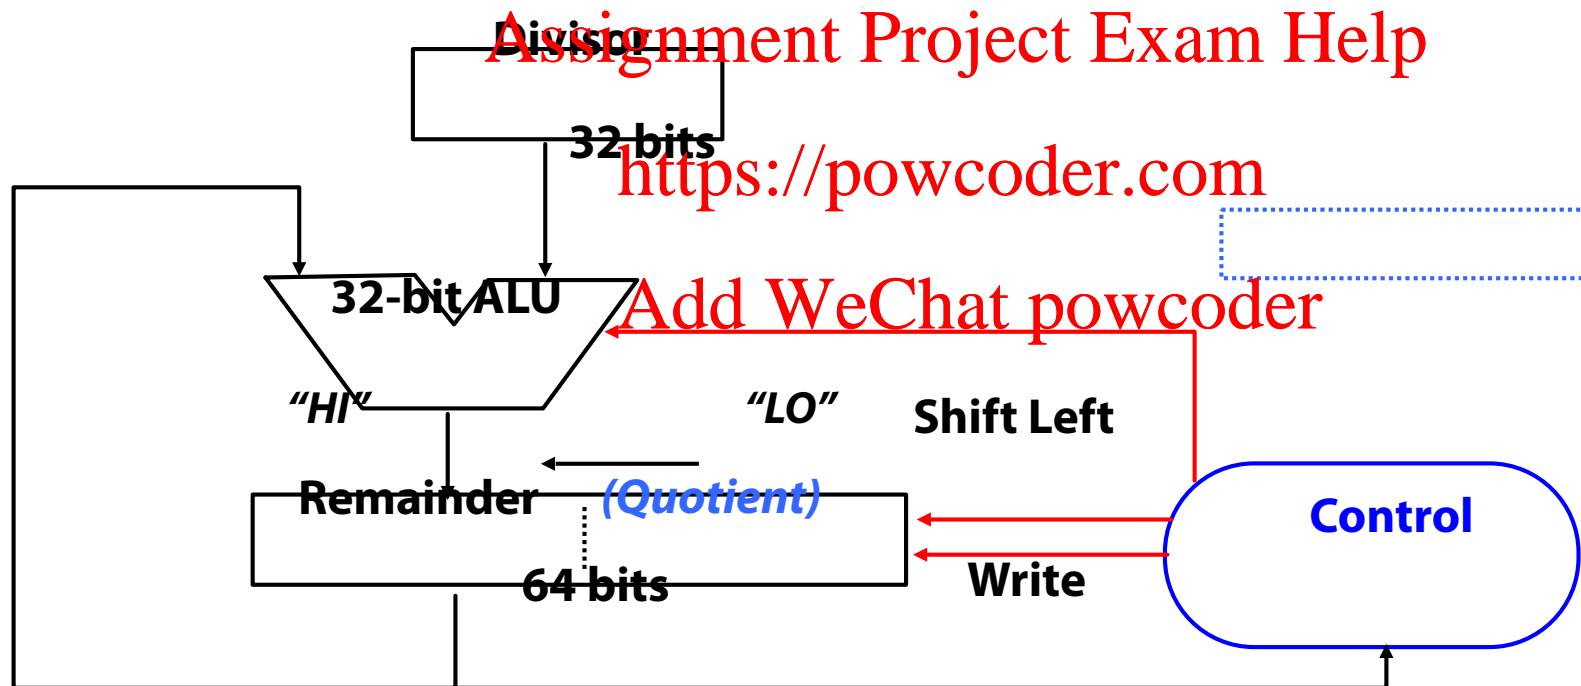

Observations on Divide Version 2

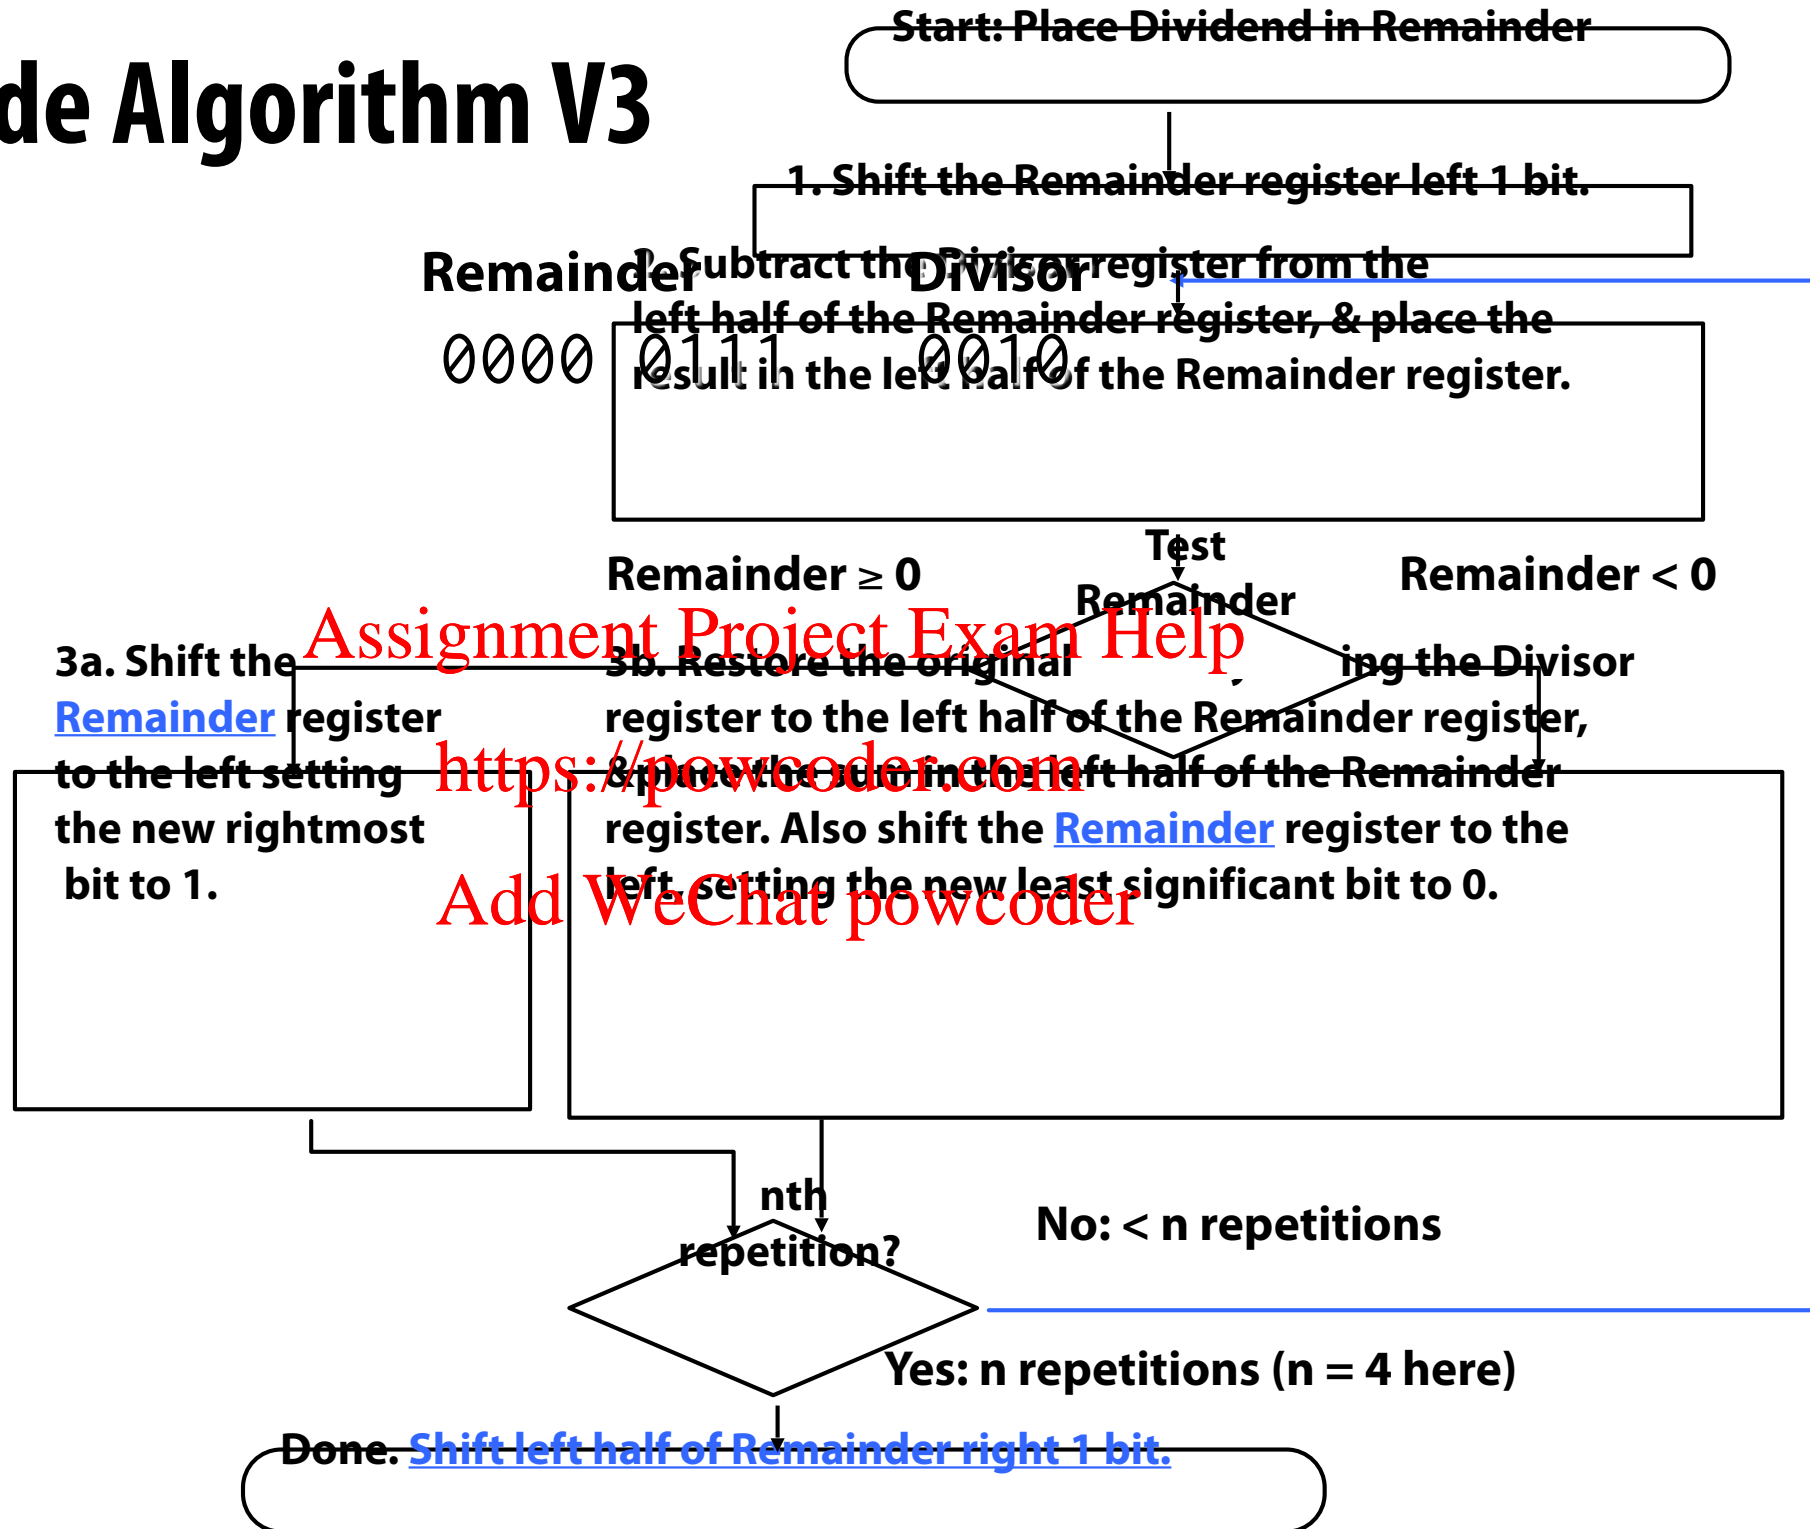

- **Eliminate Quotient register by combining with Remainder as shifted left**
 - **Start by shifting the Remainder left as before.**
 - **Thereafter loop contains only two steps because the shifting of the Remainder register shifts both the remainder in the left half and the quotient in the right half**
Assignment Project Exam Help
<https://powcoder.com>
 - **The consequence of combining the two registers together and the new order of the operations in the loop is that the remainder will shifted left one time too many.**
Add WeChat powcoder
 - **Thus the final correction step must shift back only the remainder in the left half of the register**

Divide Hardware Version 3

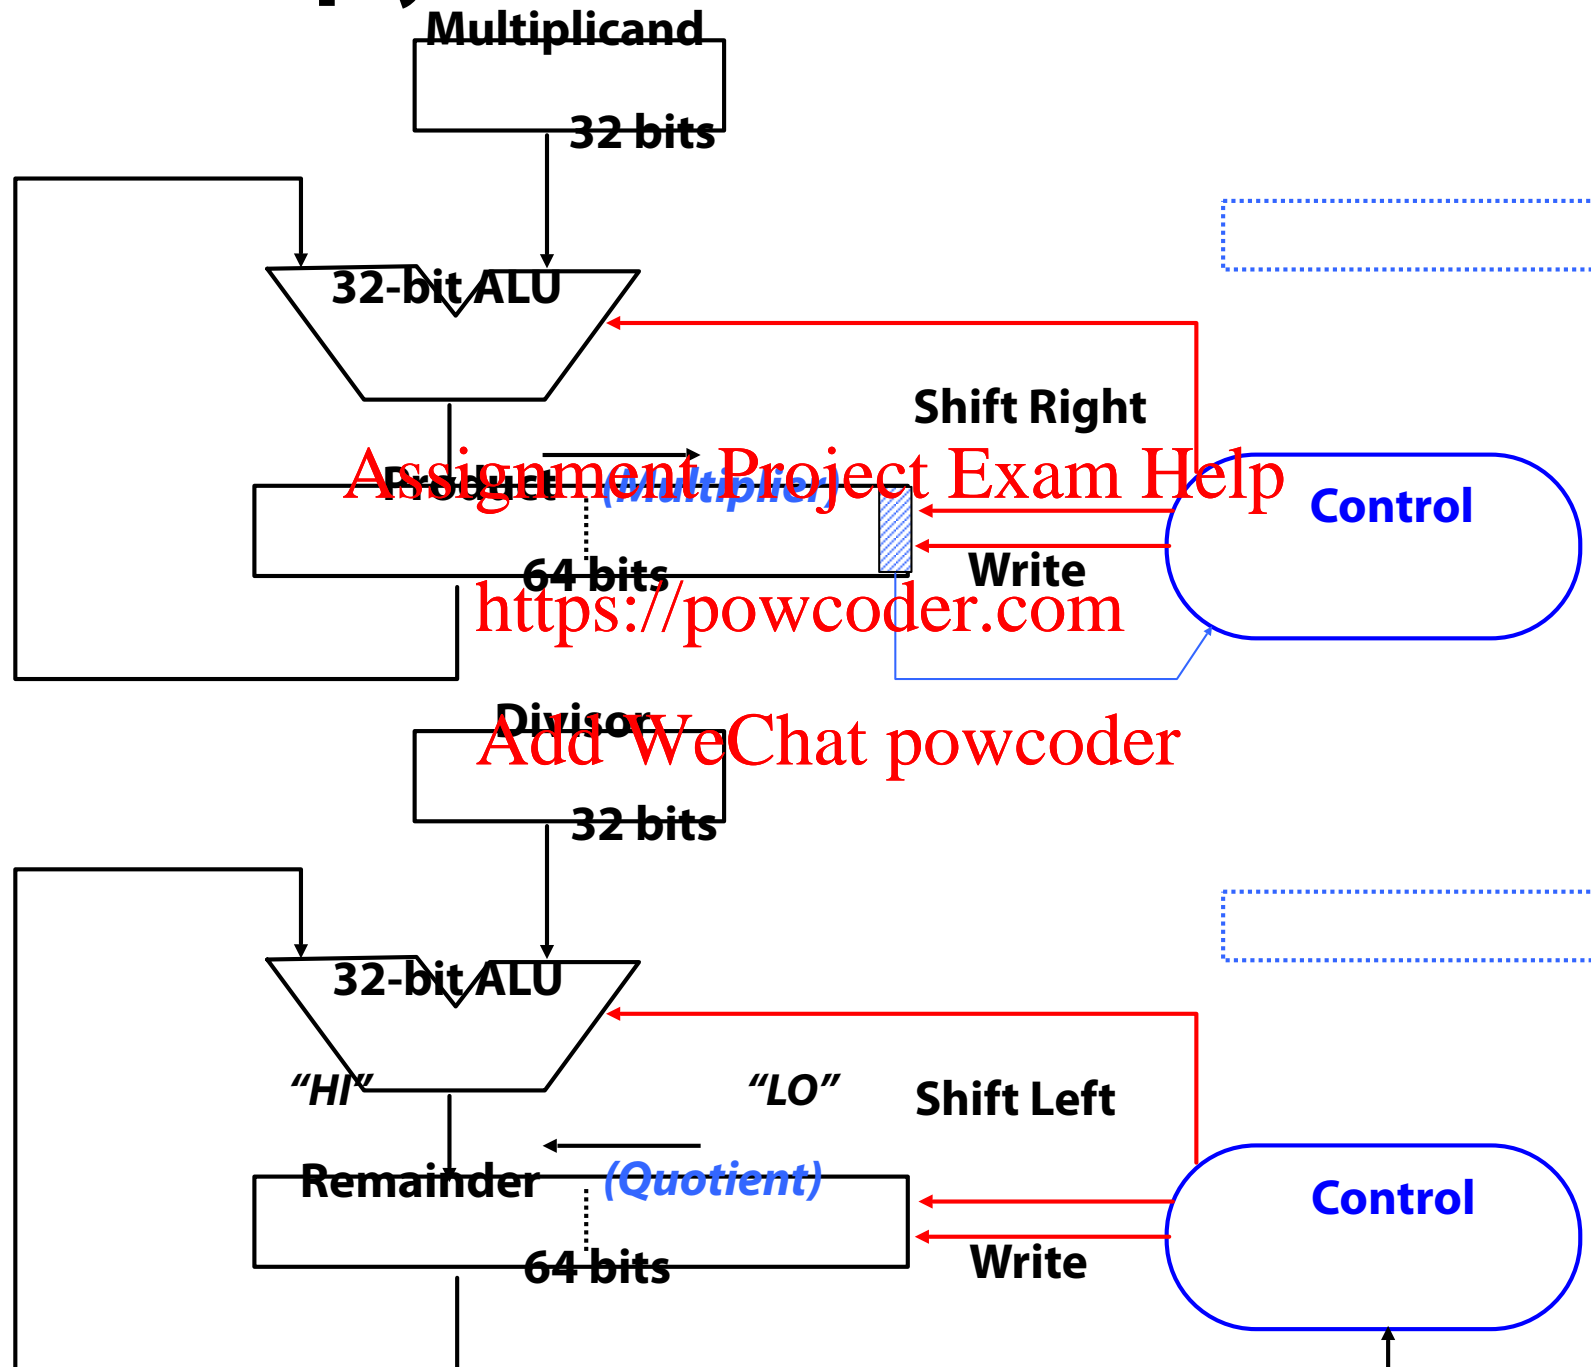

- 32-bit Divisor reg, 32-bit ALU, 64-bit Remainder reg, (0-bit Quotient reg)

Divide Algorithm V3

Final Multiply / Divide Hardware

Observations on Divide Version 3

- Same Hardware as Multiply: just need ALU to add or subtract, and 64-bit register to shift left or shift right
- Hi and Lo registers in MIPS combine to act as 64-bit register for multiply and divide
- Signed Divides: Simplest is to remember signs, make positive, and complement quotient and remainder if necessary
 - Note: Dividend and Remainder must have same sign
 - Note: Quotient negated if Divisor sign & Dividend sign disagree
e.g., $-7 \div 2 = -3$, remainder = -1
 - What about? $-7 \div 2 = -4$, remainder = $+1$
 - See <http://mathforum.org/library/drmath/view/52343.html>
- Possible for quotient to be too large: if divide 64-bit integer by 1, quotient is 64 bits (called “saturation”)

SRT Division

D. Sweeney of IBM, J.E. Robertson of the University of Illinois,
and T.D. Tocher of Imperial College, London

**P-D (Partial
Divisor) Plot**

Current
Remainder

9		9	4	3	2	1	1	1	1		
8		8	4	2	2	1	1	1	1	0	
7		7	3	2	1	1	1	1	1	0	
6		6	3	2	1	1	1	0	0	0	
5		5	2	1	1	1	0	0	0	0	
4		4	2	1	1	0	0	0	0	0

0		+	-----	-----	-----	-----	-----	-----	-----	-----	
		0	1	2	3	4	5	6	7	8	9

SRT Division

- Intel Pentium divide implementation: SRT division iteration (radix 4)
- Allows negative entries
- 1066 entries in lookup table

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

[<http://members.cox.net/srice1/pentbug/introduction.html>]

Faster Division

- Can't use parallel hardware as in multiplier
 - Subtraction is conditional on sign of remainder
- Faster dividers (e.g. SRT division) generate multiple quotient bits per step
 - Still require multiple steps

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

Division Lessons

- In practice, slower than multiplication
 - Also less frequent
 - But, in the simple case, can use same hardware!
- Generates quotient and remainder together
- Floating-point division faster than integer division (why?)
- Similar hardware lessons as multiplier:
 - Look for unused hardware
 - Can process multiple bits at once at cost of extra hardware

Shift Operations

- **Bit manipulation:**

- S EEEEEEEE MMMMMMMMMMMMMMMMMMMMMMMMMMM

& 0 1111111 0000000000000000000000000000

0 EEEEEEE

- Right shift 23 bits to get
`000000000000000000000000 EEEEEEEE`

- Do arithmetic manipulation
00000000000000000000000000000000 ENEWENEW

- Left shift 23 bits to get
0 ENEWNEW 00000000000000000000000000000000

Shift Operations

■ Arithmetic operation:

- Example: $00011 \ll 2$ [3 left shift 2]
 - $00011 \ll 2 = 01100 = 12 = 2 * 4$
- Each bit shifted left == multiply by two
- Example: $01010 \gg 1$ [10 right shift 1]
 - $01010 \gg 1 = 00101 = 5 = 10/2$
- Each bit shifted right == divide by two
- Why?
- Compilers do this—"strength reduction"

Shift Operations

■ With left shift, what do we shift in?

- $00011 \ll 2 = 01100$ (arithmetic)
- $0000XXXX \ll 4 = XXXX0000$ (logical)
- We shifted in zeroes

■ How about right shift?

- $XXXX0000 \gg 4 = 0000XXXX$ (logical)
 - Shifted in zero
- $00110 (= 6) \gg 1 = 00011 (3)$ (arithmetic)
 - Shifted in zero
- $11110 (= -2) \gg 1 = 11111 (-1)$ (arithmetic)
 - Shifted in one

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

Shift Operations

■ How about right shift?

- **XXXX0000 >> 4 = 0000XXXX: Logical shift**

- **Shifted in zero**

- **00110 (= 6) >> 1 = 00011 (3)**

11110 (= -2) >> 1 = 11111 (-1): Arithmetic shift

- **Shifted in sign bit**

■ RISC-V supports both logical and arithmetic:

- **slli, srai, srli: Shift amount taken from within instruction ("imm")**

- **sll, sra, srl: shift amount taken from register ("variable")**

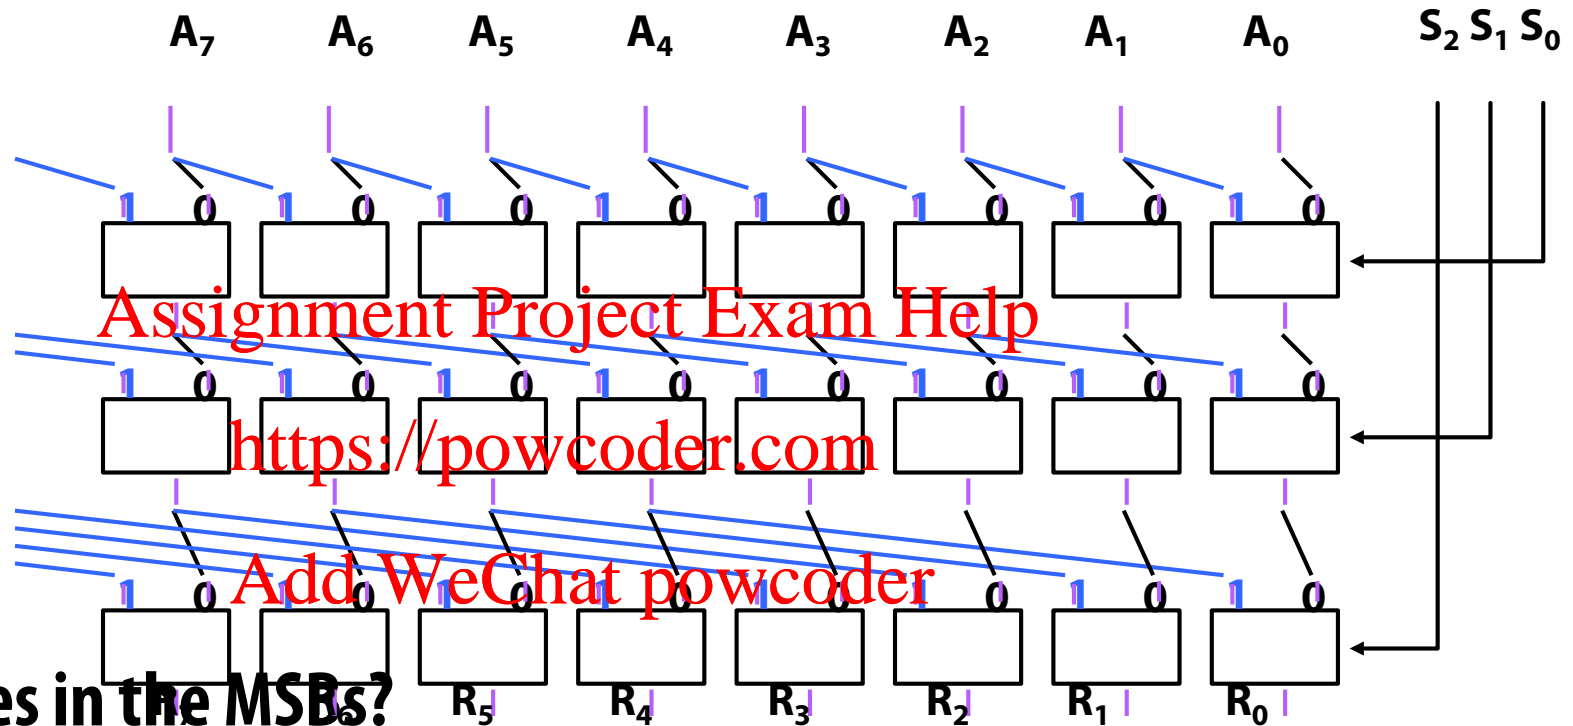

- **How far can we shift with slli/srai/slli? With sll/sra/srl?**

Combinational Shifter from MUXes

Basic Building Block

8-bit right shifter

- What comes in the MSBs?
- How many levels for 64-bit shifter?
- What if we use 4-1 Muxes ?

General Shift Right Scheme using 16 bit example

Funnel Shifter

- Shift A by i bits

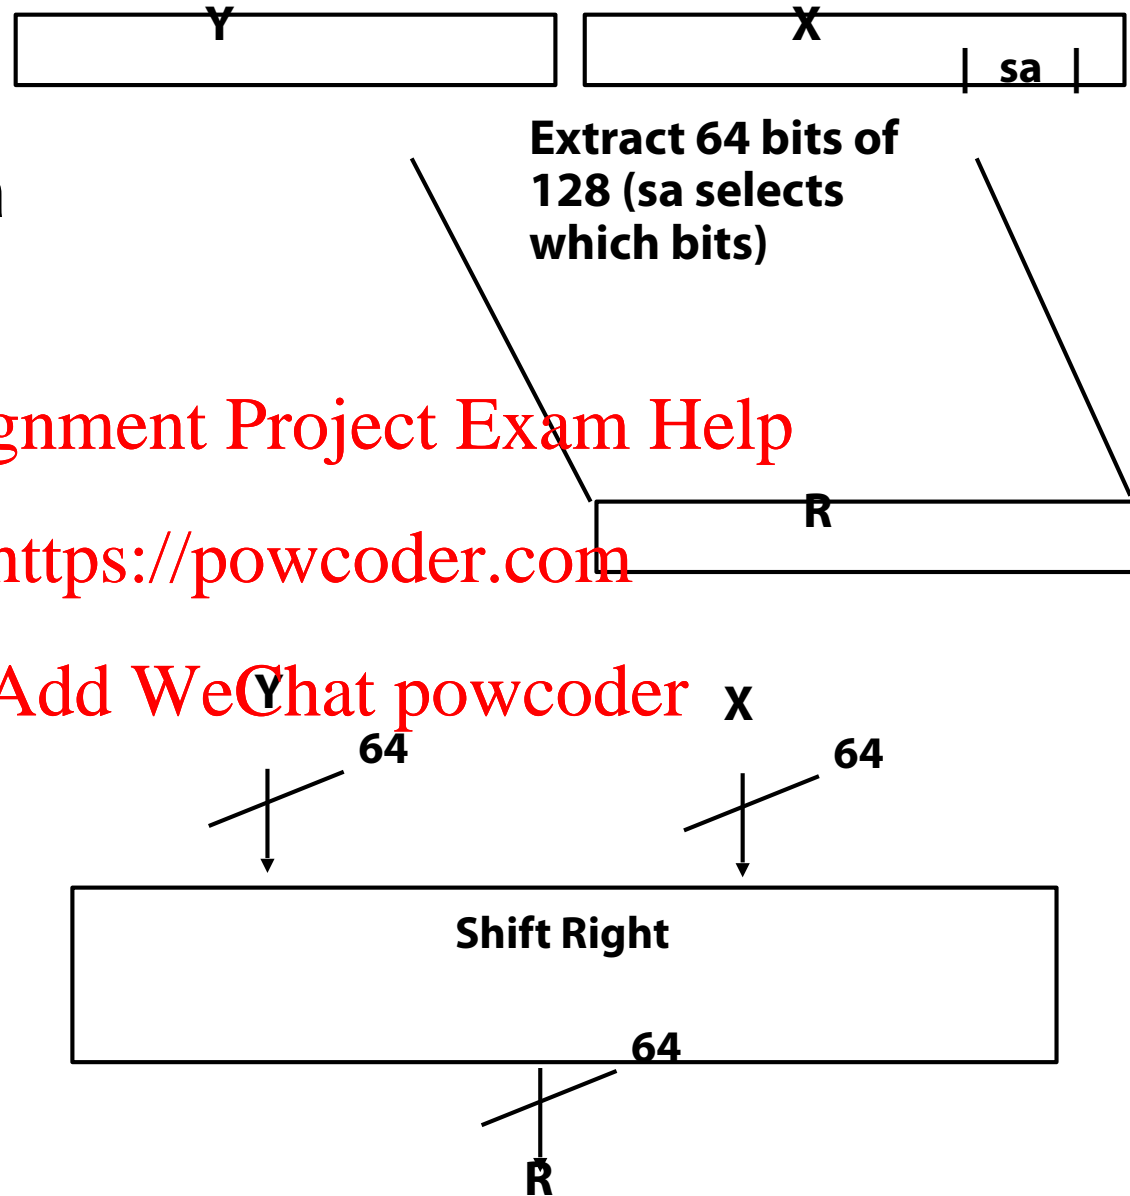

- Problem: Set Y, X, sa

- Logical:

- Arithmetic:

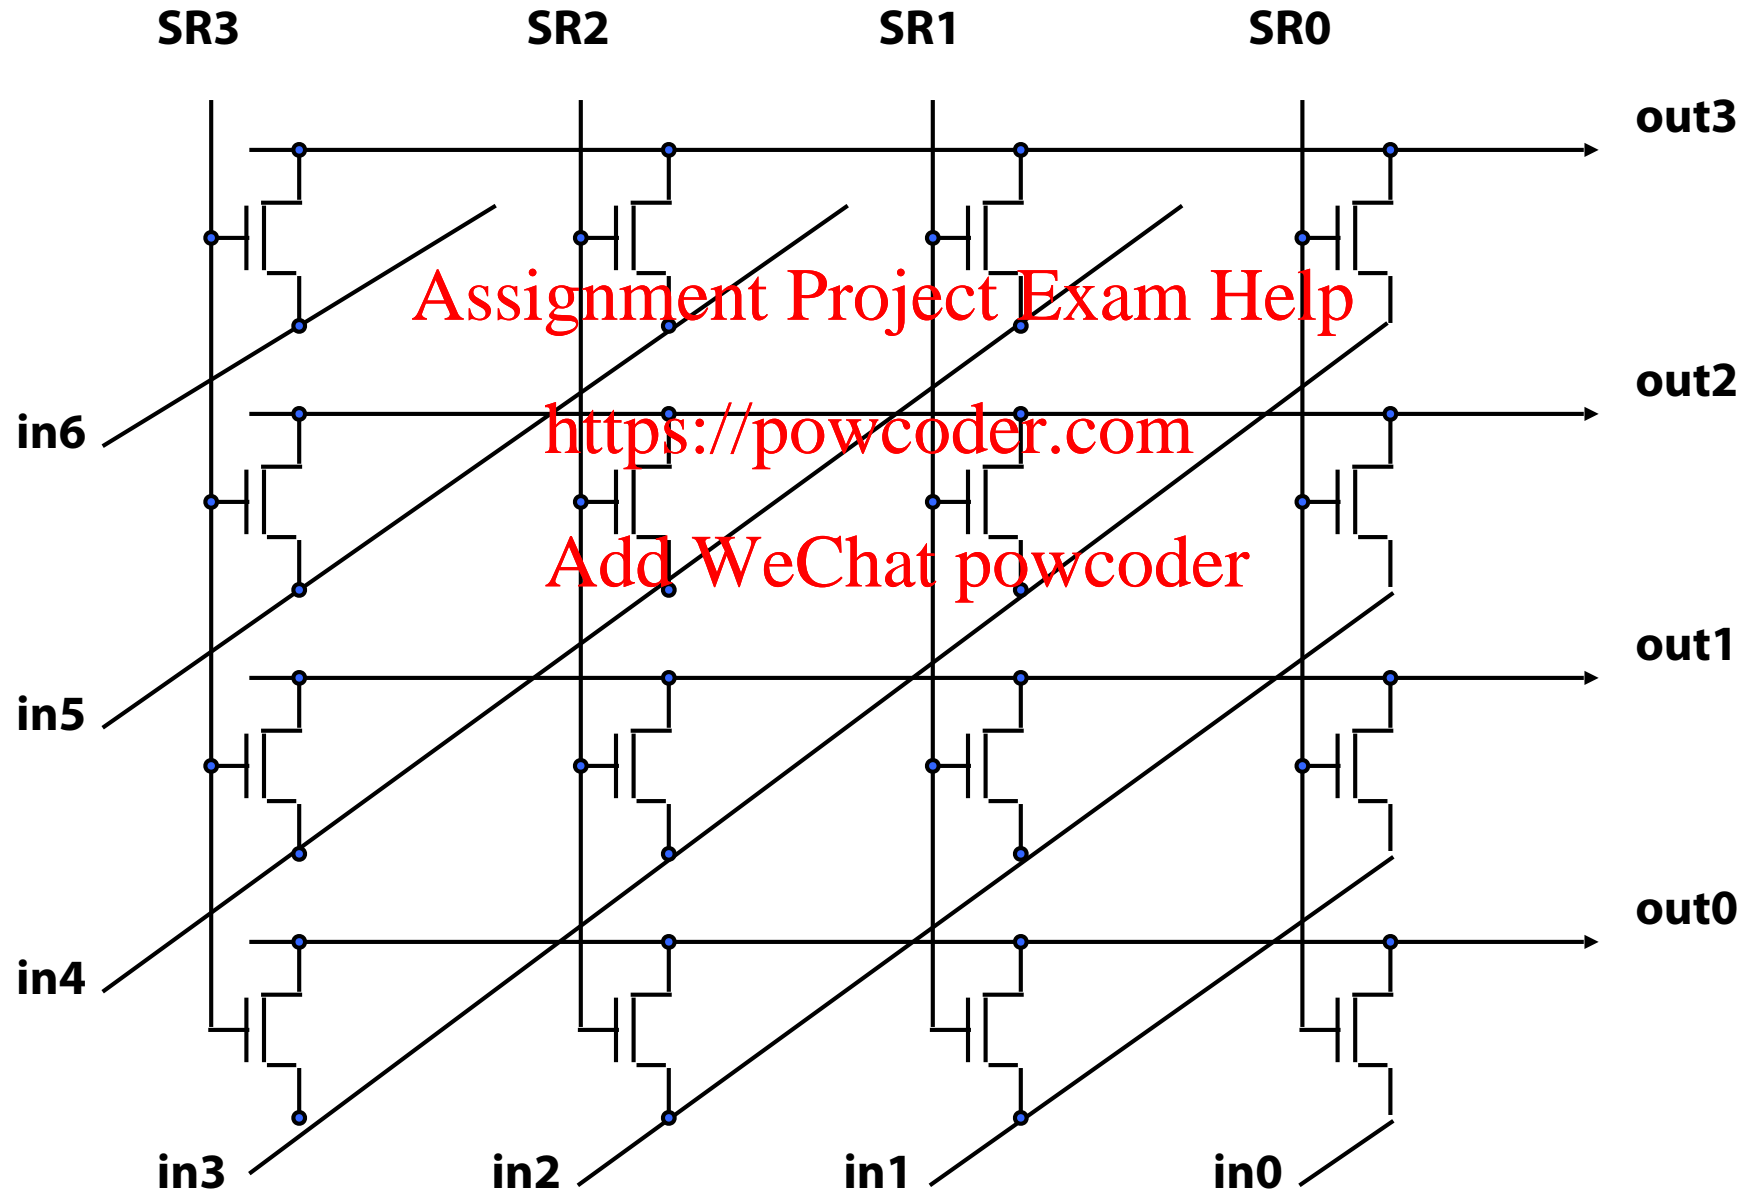

- Rotate:

- Left shifts:

Barrel Shifter

■ Technology-dependent solutions: transistor per switch

Shifter Summary

- Shifts common in logical ops, also in arithmetic
- RISC-V (oops) has:
 - 2 flavors of shift: logical and arithmetic
 - 2 directions of shift: right and left
 - 2 sources for shift amount: immediate, variable
- Lots of cool shift algorithms, but ...
 - Barrel shifter prevalent in today's hardware

Floating Point

- Representation for non-integral numbers
 - Including very small and very large numbers
- Like scientific notation
 - -2.34×10^{56} *normalized*
 - $+0.002 \times 10^{-4}$ *https://powcoder.com*
 - $+987.02 \times 10^9$ *not normalized*
- In binary
 - $\pm 1.xxxxxxx_2 \times 2^{yyyy}$
- Types `float` and `double` in C

Floating Point Standard

- Defined by IEEE Std 754-1985
- Developed in response to divergence of representations
 - Portability issues for scientific code
- Now almost universally adopted
- Two representations
 - Single precision (32-bit)
 - Double precision (64-bit)

- $\pm 1.0 \times 2^{-1022} \approx \pm 2.2 \times 10^{-308}$

■ Largest value

- Exponent: 11111111110

⇒ actual exponent = $2046 - 1023 = +1023$

- Fraction: 111...11 ⇒ significand ≈ 2.0

- $\pm 2.0 \times 2^{+1023} \approx \pm 1.8 \times 10^{+308}$

Floating-Point Precision

■ Relative precision

- all fraction bits are significant
- **Single: approx 2^{-23}**
 - Equivalent to $23 \times \log_{10} 2 \approx 23 \times 0.3 \approx 6$ decimal digits of precision
- **Double: approx 2^{-52}**
 - Equivalent to $52 \times \log_{10} 2 \approx 52 \times 0.3 \approx 16$ decimal digits of precision

Floating-Point Example

■ Represent -0.75

- $-0.75 = (-1)^1 \times 1.1_2 \times 2^{-1}$
- $S = 1$
- Fraction = $100\ldots00_2$
- Exponent = $-1 + \text{Bias}$
 - Single: $-1 + 127 = 126 = 01111110_2$
 - Double: $-1 + 1023 = 1022 = 0111111110_2$

■ Single: $1011111101000\ldots00$

■ Double: $1011111111101000\ldots00$

Floating-Point Example

- What number is represented by the single-precision float

11000000101000...00

- $S = 1$

- Fraction = 01000...00

- Exponent = 10000001₂ = 129

- $x = (-1)^1 \times (1 + .01_2) \times 2^{(129 - 127)}$

$$= (-1) \times 1.25 \times 2^2$$

$$= -5.0$$

Denormal Numbers

- Exponent = 000...0 \Rightarrow hidden bit is 0

$$x = (-1)^S \times (0 + \text{Fraction}) \times 2^{-\text{Bias}}$$

- Smaller than normal numbers
 - allow for gradual underflow, with diminishing precision
- Denormal with fraction = 000...0

$$x = (-1)^S \times (0 + 0) \times 2^{-\text{Bias}} = \pm 0.0$$

Two representations of 0.0!

Infinities and NaNs

- Exponent = 111...1, Fraction = 000...0
 - \pm Infinity
 - Can be used in subsequent calculations, avoiding need for overflow check
- Exponent = 111...1, Fraction \neq 000...0
 - Not-a-Number (NaN)
 - Indicates illegal or undefined result
 - e.g., 0.0 / 0.0
 - Can be used in subsequent calculations

Floating-Point Addition

- Consider a 4-digit decimal example

- $9.999 \times 10^1 + 1.610 \times 10^{-1}$

- 1. Align decimal points

- Shift number with smaller exponent

- $9.999 \times 10^1 + 0.016 \times 10^1$

- 2. Add significands

- $9.999 \times 10^1 + 0.016 \times 10^1 = 10.015 \times 10^1$

- 3. Normalize result & check for over/underflow

- 1.0015×10^2

- 4. Round and renormalize if necessary

- 1.002×10^2

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat @powcoder

Floating-Point Addition

- Now consider a 4-digit binary example

- $1.000_2 \times 2^{-1} + -1.110_2 \times 2^{-2} (0.5 + -0.4375)$

- 1. Align binary points

- Shift number with smaller exponent

- $1.000_2 \times 2^{-1} + -0.111_2 \times 2^{-1}$

- 2. Add significands

- $1.000_2 \times 2^{-1} + -0.111_2 \times 2^{-1} = 0.001_2 \times 2^{-1}$

- 3. Normalize result & check for over/underflow

- $1.000_2 \times 2^{-4}$, with no over/underflow

- 4. Round and renormalize if necessary

- $1.000_2 \times 2^{-4} (\text{no change}) = 0.0625$

FP Adder Hardware

- Much more complex than integer adder
- Doing it in one clock cycle would take too long
 - Much longer than integer operations
 - Slower clock would penalize all instructions
- FP adder usually takes several cycles
 - Can be pipelined

<https://powcoder.com>

Add WeChat powcoder

FP Adder Hardware

Floating-Point Multiplication

■ Consider a 4-digit decimal example

- $1.110 \times 10^{10} \times 9.200 \times 10^{-5}$

■ 1. Add exponents

- For biased exponents, subtract bias from sum

- New exponent = $-10 + +5 = -5$

■ 2. Multiply significands

- $1.110 \times 9.200 = 10.212 \Rightarrow 10.212 \times 10^5$

■ 3. Normalize result & check for over/underflow

- 1.0212×10^6

■ 4. Round and renormalize if necessary

- 1.021×10^6

■ 5. Determine sign of result from signs of operands

- $+1.021 \times 10^6$

Floating-Point Multiplication

■ Now consider a 4-digit binary example

- $1.000_2 \times 2^{-1} \times -1.110_2 \times 2^{-2} (0.5 \times -0.4375)$

■ 1. Add exponents

- Unbiased: $-1 + -2 = -3$
- Biased: $(-1 + 127) + (-2 + 127) = -3 + 254 - 127 = -3 + 127$

■ 2. Multiply significands

- $1.000_2 \times 1.110_2 = 1.110_2 \Rightarrow 1.110_2 \times 2^{-3}$

■ 3. Normalize result & check for over/underflow

- $1.110_2 \times 2^{-3}$ (no change) with no over/underflow

■ 4. Round and renormalize if necessary

- $1.110_2 \times 2^{-3}$ (no change)

■ 5. Determine sign: +ve \times -ve \Rightarrow -ve

- $-1.110_2 \times 2^{-3} = -0.21875$

FP Arithmetic Hardware

- FP multiplier is of similar complexity to FP adder
 - But uses a multiplier for significands instead of an adder
- FP arithmetic hardware usually does
 - Addition, subtraction, multiplication, division, reciprocal, square-root
 - FP \leftrightarrow integer conversion
- Operations usually takes several cycles
 - Can be pipelined

<https://powcoder.com>

Add WeChat powcoder

FP Instructions in RISC-V

- Separate FP registers: f0, ..., f31
 - double-precision
 - single-precision values stored in the lower 32 bits
- FP instructions
 - Programs generally don't do integer ops on FP data, or vice versa
 - More registers with minimal code-size impact
- FP load and store instructions
 - flw, fld
 - fsw, fsd

Assignment Project Extra Help

<https://powcoder.com>

Add WeChat powcoder

FP Instructions in RISC-V

■ Single-precision arithmetic

- fadd.s, fsub.s, fmul.s, fdiv.s, fsqrt.s
 - e.g., fadd.s f2, f4, f6

■ Double-precision arithmetic

- fadd.d, fsub.d, fmul.d, fdiv.d, fsqrt.d
 - e.g., fadd.d f2, f4, f6

■ Single- and double-precision comparison

- feq.s, flt.s, fle.s
- feq.d, flt.d, fle.d
- **Result is 0 or 1 in integer destination register**
 - Use beq, bne to branch on comparison result

■ Branch on FP condition code true or false

- B.cond

FP Example: °F to °C

■ C code:

```
float f2c (float fahr) {  
    return ((5.0/9.0)*(fahr - 32.0));  
}
```

- fahr in f10, result in f10, literals in global memory space

■ Compiled RISC-V code:

f2c:

```
flw    f0,const5(x3)    // f0 = 5.0f  
flw    f1,const9(x3)    // f1 = 9.0f  
fdiv.s f0, f0, f1       // f0 = 5.0f / 9.0f  
flw    f1,const32(x3)   // f1 = 32.0f  
fsub.s f10,f10,f1       // f10 = fahr - 32.0  
fmul.s f10,f0,f10       // f10 = (5.0f/9.0f) * (fahr-32.0f)  
jalr   x0,0(x1)         // return
```

FP Example: Array Multiplication

- $C = C + A \times B$

- All 32×32 matrices, 64-bit double-precision elements

- C code:

- ```
void mm (double c[][],
 double a[][], double b[][]) {
 size_t i, j, k;
 for (i = 0; i < 32; i = i + 1)
 for (j = 0; j < 32; j = j + 1)
 for (k = 0; k < 32; k = k + 1)
 c[i][j] = c[i][j]
 + a[i][k] * b[k][j];
}
```

- Addresses of c, a, b in x10, x11, x12, and  
i, j, k in x5, x6, x7

# FP Example: Array Multiplication

## ■ RISC-V code:

mm: . . .

```
 li x28,32 // x28 = 32 (row size/loop end)
 li x5,0 // i = 0; initialize 1st for loop
L1: li x6,0 // j = 0; initialize 2nd for loop
L2: li x7,0 // k = 0; initialize 3rd for loop
 slli x30,x5,5 // x30 = i * 2**5 (size of row of c)
 add x30,x30,x6 // x30 = i * size(row) + j
 slli x30,x30,3 // x30 = byte offset of [i][j]
 add x30,x10,x30 // x30 = byte address of c[i][j]
 fld f0,0(x30) // f0 = c[i][j]
L3: slli x29,x7,5 // x29 = k * 2**5 (size of row of b)
 add x29,x29,x6 // x29 = k * size(row) + j
 slli x29,x29,3 // x29 = byte offset of [k][j]
 add x29,x12,x29 // x29 = byte address of b[k][j]
 fld f1,0(x29) // f1 = b[k][j]
```

# FP Example: Array Multiplication

```
...
slli x29,x5,5 // x29 = i * 2**5 (size of row of a)
 add x29,x29,x7 // x29 = i * size(row) + k
 slli x29,x29,3 // x29 = byte offset of [i][k]
 add x29,x11,x29 // x29 = byte address of a[i][k]
 fld f2,0(x29) // f2 = a[i][k]
 fmul.d f1,f2,f1 // f1 = a[i][k] * b[k][j]
 fadd.d f0,f0,f1 // f0 = c[i][j] + a[i][k] * b[k][j]
 addi x7,x7,1 // k = k + 1
 bltu x7,x28,L3 // if (k < 32) go to L3
 fsd f0,0(x30) // c[i][j] = f0
 addi x6,x6,1 // j = j + 1
 bltu x6,x28,L2 // if (j < 32) go to L2
 addi x5,x5,1 // i = i + 1
 bltu x5,x28,L1 // if (i < 32) go to L1
```

# Accurate Arithmetic

- IEEE Std 754 specifies additional rounding control
  - Extra bits of precision (guard, round, sticky)
  - Choice of rounding modes
  - Allows programmer to fine-tune numerical behavior of a computation
- Not all FP units implement all options
  - Most programming languages and FP libraries just use defaults
- Trade-off between hardware complexity, performance, and market requirements

<https://powcoder.com>

Add WeChat powcoder

# Subword Parallelism

- Graphics and audio applications can take advantage of performing simultaneous operations on short vectors
  - Example: 128-bit adder:
    - Sixteen 8-bit adds
    - Eight 16-bit adds
    - Four 32-bit adds
- Also called data-level parallelism, vector parallelism, or Single Instruction, Multiple Data (SIMD)

# x86 FP Architecture

- Originally based on 8087 FP coprocessor
  - $8 \times 80$ -bit extended-precision registers
  - Used as a push-down stack
  - Registers indexed from TOS: ST(0), ST(1), ...
- FP values are 32-bit or 64 in memory
  - Converted on load/store of memory operand
  - Integer operands can also be converted on load/store
- Very difficult to generate and optimize code
  - Result: poor FP performance

# x86 FP Instructions

## ■ Optional variations

| Data transfer                                                                                                                                       | Arithmetic                                                                                   | Compare                           | Transcendental                                              |

# Right Shift and Division

- Left shift by  $i$  places multiplies an integer by  $2^i$
- Right shift divides by  $2^i$ ?
  - Only for unsigned integers
- For signed integers
  - Arithmetic right shift: replicate the sign bit
  - e.g.,  $-5 / 4$ 
    - $11111011_2 \gg 2 = 11111110_2 = -2$
    - Rounds toward  $-\infty$
  - c.f.  $11111011_2 \ggg 2 = 00111110_2 = +62$

# Associativity

- Parallel programs may interleave operations in unexpected orders
  - Assumptions of associativity may fail

|   |           | $(x+y)+z$ | $x+(y+z)$ |
|---|-----------|-----------|-----------|
| x | -1.50E+38 | -1.50E+38 | -1.50E+38 |
| y | 1.50E+38  | 0.00E+00  | 0.00E+00  |
| z | 1.0       | 1.0       | 1.50E+38  |
|   |           | 1.00E+00  | 0.00E+00  |

- Need to validate parallel programs under varying degrees of parallelism

# Who Cares About FP Accuracy?

- Important for scientific code

- But for everyday consumer use?
  - “My bank balance is out by 0.0002¢!” ☹

Assignment Project Exam Help

- The Intel Pentium FDIV bug <https://powcoder.com>

- The market expects accuracy
- See Colwell, *The Pentium Chronicles*

# Concluding Remarks

- Bits have no inherent meaning
  - Interpretation depends on the instructions applied
- Computer representations of numbers
  - Finite range and precision
  - Need to account for this in programs
- ISAs support arithmetic
  - Signed and unsigned integers
  - Floating-point approximation to reals
- Bounded range and precision
  - Operations can overflow and underflow

# AND and OR

- Instead, generate several functions and use control bits to select using a mux

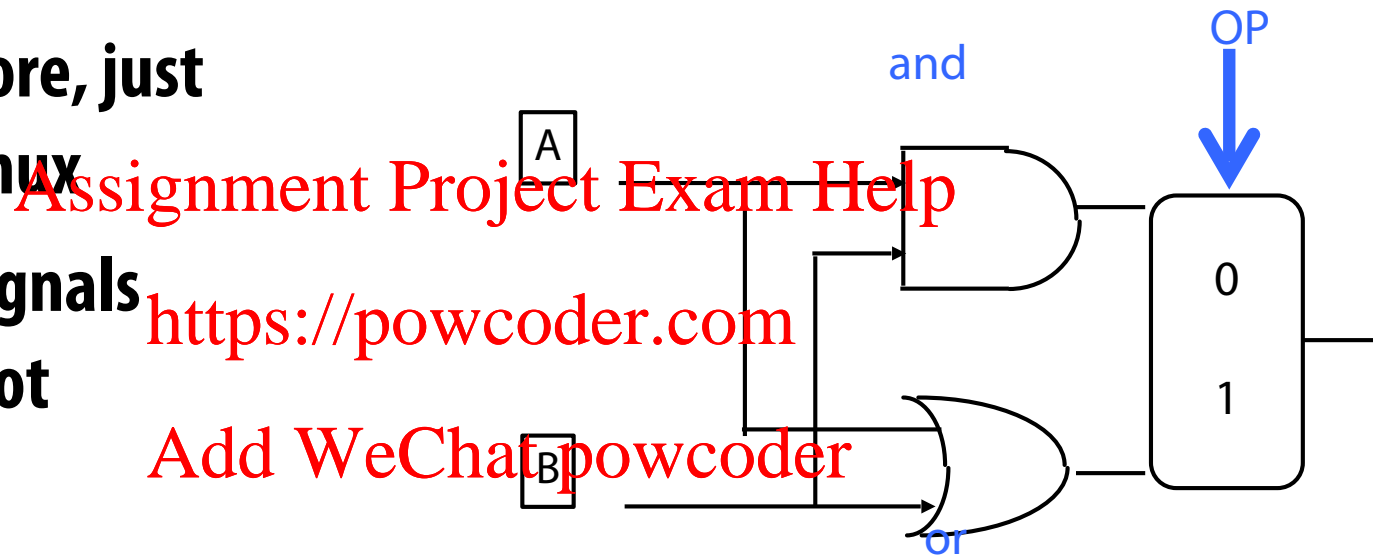

- Not easy to decide the “best” way to build something
  - Don't want too many inputs to a single gate
  - Don't want to have to go through too many gates
  - For our purposes, ease of comprehension is important

# Supporting More Functions

## ■ With the mux approach, it's easy to add other functions

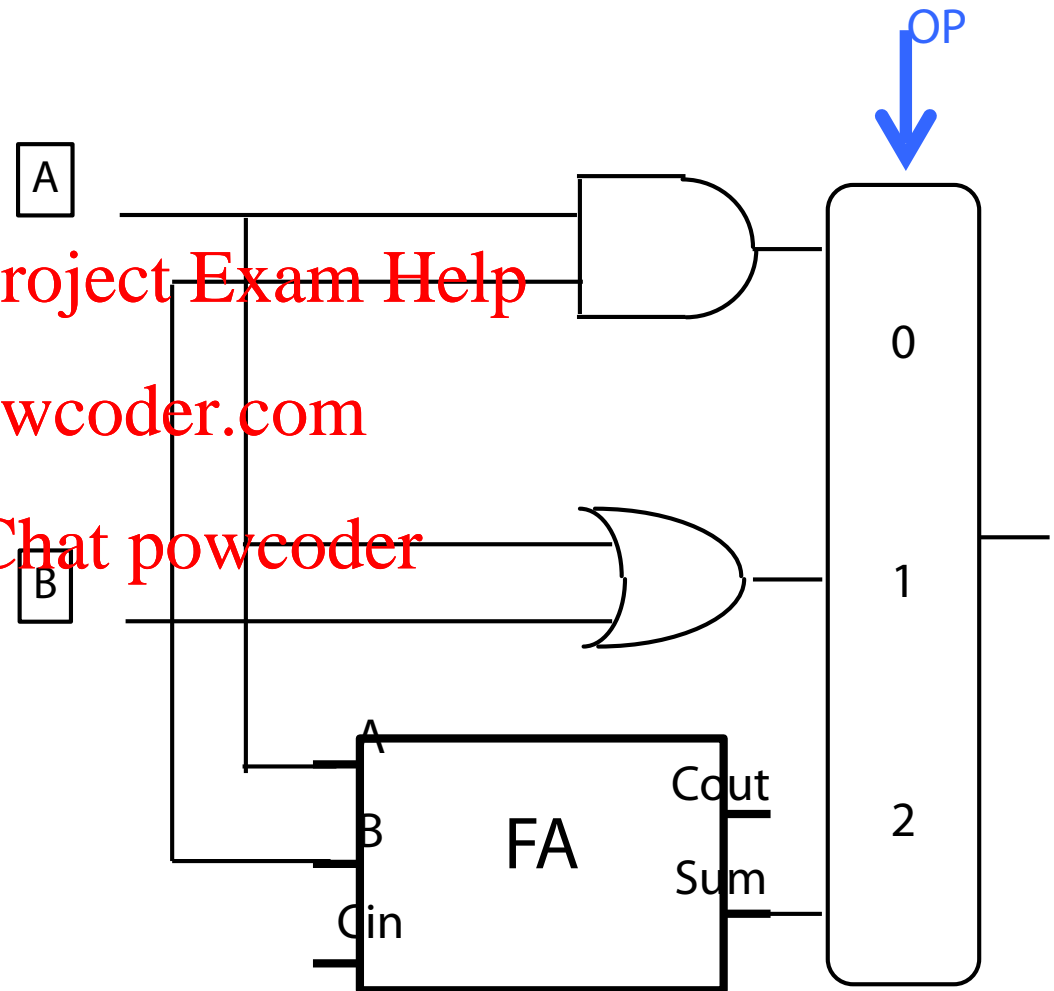

- Like add
- To add more, just enlarge mux
- Control signals in mux, not datapath

# Supporting More Functions

## ■ With the mux approach, it's easy to add other functions

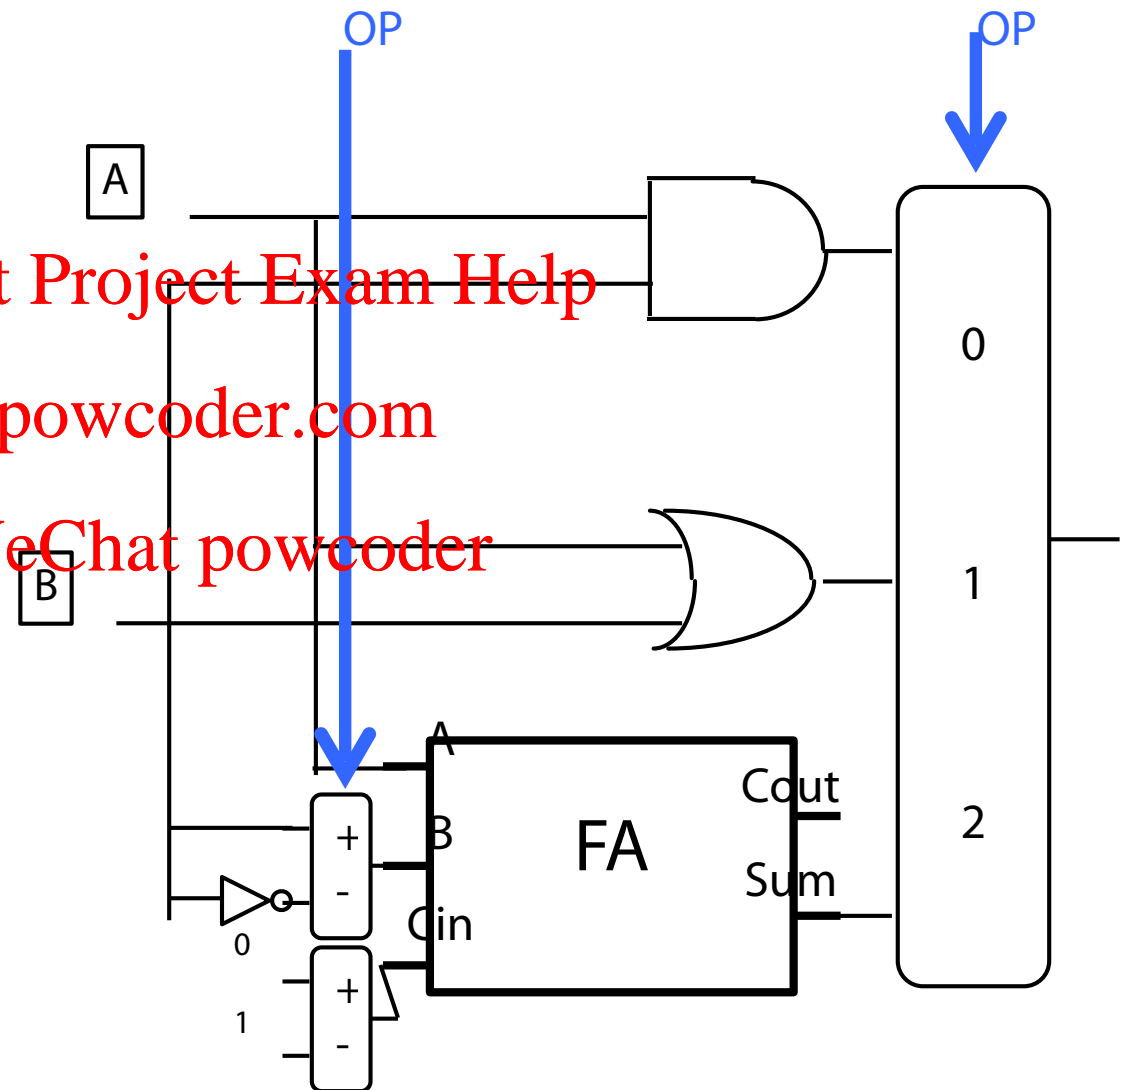

- Like add
- To add more, just enlarge mux
- Control signals in mux, not datapath

# Supporting More Functions

## ■ With the mux approach, it's easy to add other functions

- Like add
- To add more, just enlarge mux (or put more muxes elsewhere)
- Control signals in muxes, not datapath

# Tailoring the ALU to RISC-V

## ■ Need to support the set-on-less-than instruction (slt)

- slt produces a 1 if  $rs < rt$  and 0 otherwise
- use subtraction:  $(a-b) < 0$  implies  $a < b$
- So now we Assignment Project Exam Help  
to slt operation? What do we have to test and where does it go?  
<https://powcoder.com>
- We test Add WeChat powcoder
- To produce the proper result, it goes in

# Tailoring the ALU to RISC-V

## ■ Need to support the set-on-less-than instruction (slt)

- slt produces a 1 if  $rs < rt$  and 0 otherwise
- use subtraction:  $(a-b) < 0$  implies  $a < b$
- So now we assign a bus our result. How does this translate to slt operation? What do we have to test and where does it go?  
<https://powcoder.com>  
Add WeChat powcoder
- We test  
*the highest (sign) bit ( $S[31]$ )*
- To produce the proper result, it goes in  
*the lowest bit ( $S[0]$ )*

# Why do you think the MIPS-V designers

# Original Diagram: bit-slice ALU

# Revised Diagram

- LSB and MSB need to do a little extra

# Behavioral Representation: Verilog

```
module ALU(A, B, m, S, c, ovf);
 input [0:31] A, B;
 input [0:3] m;
 output [0:31] S;
 output c, ovf;
```

```
 reg [0:31] S;
 reg c, ovf;
```

```
 always @(A, B, m) begin
```

```
 case (m)
```

```
 0: S = A + B;
```

```
 1: S = A - B;
```

```
 2: S = ...
```

```
 . . .
```

```
 end
```

```
endmodule
```

# Conclusion

- We can build an ALU to support the RISC-V instruction set
  - key idea: use multiplexor to select the output we want
  - we can efficiently perform subtraction using two's complement
  - we can replicate a 1-bit ALU to produce a 32-bit ALU
- Important points about hardware
  - all of the gates are always working
  - the speed of a gate is affected by the number of inputs to the gate
  - the speed of a circuit is affected by the number of gates in series  
(on the “critical path” or the “deepest level of logic”)

# MIPS arithmetic instruction format

What does the red bit do?

“Perhaps it is surprising that addiu and sltiu also sign-extend their immediates, but they do. The u stands for unsigned, but in reality addiu is often used simply as an add instruction that cannot overflow, and then we often want to add negative numbers. *It's much harder to come up with an instruction where sltiu sign extends its immediate field.*” COD2E p. 230
